

Washington State Immunization Information System Update:

A new release of the Washington State Immunization Information System (WA IIS) is moving into production on October 24, 2014. We have a few changes related to inventory and doses administered reporting. This document includes a summary of the changes and known issues.

Inventory Management

- Vaccines on the Reconcile Inventory page can now be sorted by vaccine type, expiration and public and private lots.

Doses Administered Reporting

- The “Washington State Vaccine Monthly Doses Administered Report” under State Reports is now working, but LHJs can only search by a single PIN at a time. LHJs can run this report to view doses administered reports submitted by a provider. This report can also be exported in a Microsoft Excel friendly format.
- When submitting a Vaccine Administered Report, the vaccination date range “From” and “Through” will pre-populate after the Reporting Month is selected. The dates will not pre-populate if the provider is submitting this report for the first time.
 - The “**From**” date will pre-populate based on the provider’s last submitted report. The “From” date will show the date of the day after the “Through” date on their last submitted report. This date cannot be edited by the provider.
 - The “**Through**” date will show the current date. The “From” and “Through” date range cannot exceed 45 days. If the “From” date and current date is in excess of 45 days, the “Through” date will then display with the date of 45 day after the “From” date. The provider can edit the “Through” date to be less than 45, but cannot exceed 45 days.

Known Issues

- Doses Administered Button on the create order page and order approval page are not working correctly.
- The “Washington State Vaccine Monthly Doses Administered Report” under State Reports does not work when searching for a PIN range.
