2401-W WASTE STORAGE BUILDING
ADDENDUM H
CLOSURE PLAN
CHANGE CONTROL LOG

Change Control Logs ensure that changes to this unit are performed in a methodical, controlled, coordinated, and transparent manner. Each unit addendum will have its own change control log with a modification history table. The “Modification Number” represents Ecology’s method for tracking the different versions of the permit. This log will serve as an up to date record of modifications and version history of the unit.

H.1 Introduction

The purpose of this plan is to describe the Resource Conservation and Recovery Act of 1976 (RCRA)/Hazardous Waste Management Act (HWMA), Chapter 70A.300 Revised Code of Washington (RCW) closure process for the 2401-W Waste Storage Building Dangerous Waste Management Unit (DWMU), hereinafter called the 2401-W Building. The 2401-W Building is located in the southeastern portion of the Central Waste Complex (CWC)-Waste Receiving and Processing (WRAP) Complex in the 200 West Area of the Hanford Site (Figure H-1). The U.S. Department of Energy (DOE) and Central Plateau Cleanup Company, LLC (CPCCo), hereinafter called the Permittees, have agreed with the U.S. Environmental Protection Agency (EPA) and Washington State Department of Ecology (Ecology) through a Consent Agreement and Final Order (EPA Docket No. RCRA-10-2013-0113) to close this DWMU. The 2401-W Building is no longer used for storage of dangerous or mixed waste and will be clean closed.

This closure plan complies with closure requirements in Washington Administrative Code (WAC) 173-303-610(2) through WAC 173-303-610(6), Closure and post-closure, and WAC 173-303-630(10), Use and management of containers.

Amendments to this closure plan must be submitted as a permit modification request in accordance with Permit Condition I.C.3.

Minor deviations from this closure plan must be addressed in accordance with Permit Condition II.K.6.

Closure requirements are based on RCW 70A.300, WAC 173-303, and Ecology guidance (Ecology Publication #94-111, Guidance for Clean Closure of Dangerous Waste Units and Facilities).

This closure plan is also designed to fulfill the elements of the Data Quality Objectives (DQO) Process, as defined in EPA Publication EPA/240/B-06/001, Guidance on Systematic Planning Using the Data Quality Objective Process (EPA QA/G-4). A site-specific DQO has been incorporated into this closure plan.

This closure plan describes in detail the closure activities necessary to achieve closure performance standards for the 2401-W Building. Closure activities include:

- Removal of all dangerous and mixed waste.
- Records review (i.e., container storage, operating, and inspection records) for documented spills or releases of dangerous or mixed waste and subsequent cleanup activities.
- Visual inspection to evaluate the condition of the floor surfaces and the likelihood of potential exposure pathways for contamination of the underlying soil.
- Decontaminate the concrete surface to meet the Alternative Treatment Standards for Hazardous Debris (i.e., removal of at least 0.6 cm of the surface layer; treatment to a clean debris surface).
- Visual inspection to confirm clean debris surface standard has been met.
- Sampling of underlying soil to evaluate whether closure performance standards are met.
- Transmit closure certification to Ecology.

Closure will be performed in accordance with the schedule provided in Section H.6.
Figure H-1 Central Waste Complex-Waste Receiving and Processing Complex Overview, 2401-W Building Dangerous Waste Management Unit (Month Unknown, 2017)

H.1.1 Unit Description

The 2401-W Building is located on the south end of the CWC. The 2401-W Building is a pre-engineered steel structure. It is approximately 15 m (50 ft) wide by 24 m (80 ft) long by 6 m (20 ft) high (to the eave). The foundation is integrated into a perimeter concrete curb 15.2 cm (6 in.) above grade. Ramps were placed across the curb for loading and unloading operations. The floors were coated with an epoxy resin floor surfacing system that was compatible with the stored waste. Figure H-2 shows the general dimensions and layout of the 2401-W Building, and provides perspective for the pictures of this area that follow. Figure H-3 shows the 2401-W Building from west side of the building. Figure H-4 shows the interior of the 2401-W Building from the south. Figure H-5 shows an overhead view of the 2401-W Building.

The 2401-W Building does not currently store dangerous or mixed waste. Future dangerous waste container storage and treatment of dangerous and mixed waste within the 2401-W Building is not authorized. Currently it primarily serves as equipment and material storage, as well as recyclable and universal waste storage to support the CWC-WRAP operational activities.
Figure H-2  Dimensions of 2401-W Building

Figure H-3  2401-W Building (East) (February 2018)
Figure H-4  2401-W Waste Storage Building Interior View (Center) (February 2018)

Figure H-5  Overhead View of 2401-W Building (East) (October 2017)
H.1.2 Maximum Waste Inventory

Waste management records indicate that the maximum inventory of dangerous and mixed waste stored in the 2401-W Building over its lifetime included 318 containers with a total volume of 203 m³ (266 yd³). Dangerous waste was first stored in 2401-W Building in May 1989. The 2401-W Building also stored dangerous and mixed waste in a Central Accumulation Area (CAA). Details on the dangerous and mixed waste containers are presented in Section H.3.2.

H.1.3 Personnel Safety and Training Requirements

Closure will be performed in a manner to ensure the safety of Human Health and the Environment (HHE). Health and safety requirements are addressed in Section H.1.3.1, and training for facility and closure personnel is described in Section H.1.3.2.

H.1.3.1 Health and Safety Requirements

Personnel will be trained in the applicable safety and environmental procedures described in Table H-1. Personnel will be equipped with appropriate personal protective equipment. Personnel will perform all field operations and any necessary closure activities in compliance with applicable health, safety, and environmental procedures and requirements.

Pre-job briefings will be performed to evaluate activities and associated hazards by considering the following factors:

• Objective of the activities.
• Individual tasks to be performed.
• Hazards associated with the planned tasks.
• Environment in which the job will be performed.
• Facility where the job will be performed.
• Equipment and material required.
• Safety protocols applicable to the job.
• Training requirements for individuals assigned to perform the work.
• Level of management control.
• Proximity of emergency contacts.

H.1.3.2 Training Requirements

The Permittees have instituted training and qualification programs to meet training requirements imposed by regulations, DOE orders, and national standards such as those published by the American National Standards Institute/American Society of Mechanical Engineers. For example, the environmental, safety, and health training program provides workers with the knowledge and skills necessary to execute assigned duties safely. Permit Attachment 5, Hanford Facility Personnel Training Program, describes specific requirements for the Hanford Facility Personnel Training Program. The Permittees will comply with the training matrix shown in Table H-1, which provides training requirements for Hanford Facility personnel associated with the 2401-W Building.

Project-specific safety training will provide the knowledge and skills that personnel need to perform work safely and in accordance with Quality Assurance (QA) requirements. Training records are maintained for each employee in an electronic training record database. The Permittee’s training organization maintains the training records system.

H.1.4 Maintenance and Security During Closure
To maintain the 2401-W Building in a compliant manner during closure, measures are taken to ensure inspections are performed, and security and emergency preparedness activities are in place.

H.1.4.1 Inspections
The 2401-W Building will be closed in a manner that demonstrates that all steps to prevent threats to HHE have been met and will continue to be taken. After closure activities have been completed, the 2401-W Building will be inspected annually until Ecology approves the unit closure certification.

Table H-2 shows annual inspection requirements that will be performed.

*a* The storage area is empty of dangerous and mixed waste. “No waste in storage” or equivalent words will be entered on the inspection log.

H.1.4.2 Facility Security
The following sections document security measures in effect at the CWC-WRAP.
H.1.4.2.1 Security Provisions

Located within the 200 West Area of the Hanford Facility, CWC-WRAP complies with access control and warning sign requirements pursuant to WAC 173-303-310(1) and (2), Security.

Security measures are used to control access to the active portions of the Hanford Facility in accordance with Permit Condition II.M, Security.

The entire Hanford Facility is a controlled access area as described in Permit Attachment 3, Security. The security measures in Permit Attachment 3 and the unit-specific security measures prevent the unknowing entry, and minimize the possibility for the unauthorized entry, of persons or livestock. [WAC173-303-310(1)]

H.1.4.2.2 Central Waste Complex-Waste Receiving and Processing Access Control

Unknowing entry and the possibility for unauthorized entry of persons or livestock onto the active portions of the CWC-WRAP are minimized through implementation and maintenance of the following security measures.

Access to CWC-WRAP DWMUs is controlled by an approximate 2.1 m (7 ft) high chain link fence encircling the CWC-WRAP perimeter (Figure H-1). Alternate vehicle entry gates at points in the perimeter fence are either locked or, when open for operations, subject to surveillance by CWC-WRAP personnel. Authorization clearance for all entrants to the CWC-WRAP is required. During non-operations hours, the main gate is locked. Gate keys are controlled and accessible by authorized personnel only. [WAC 173-303-310(2)(c)]

Visitors to the CWC-WRAP are required to sign in and adhere to all personal protection requirements, and are subject to escorting protocols.

Section H.1.3.2 provides the personnel training requirements for CWC-WRAP operators, workers, and visitors.

Access to the 2401-W Waste Storage Building is restricted by the CWC-WRAP access controls described above.

H.1.4.2.3 Warning Signs

Warning signs stating “Danger-Unauthorized Personnel Keep Out” are posted near the entrance gate of the CWC-WRAP. Identical signs are posted along the perimeter fence lines at distances not to exceed 250 ft (76.2 meters) between signs. Permittees must maintain warning signs at points described in this closure plan and ensure that signs are written in English, legible from a distance of 25 ft. (approximately 7.6 m) or more, and visible from all angles of approach. [WAC 173-303-310(2)(a)]

H.1.4.3 Preparedness, Prevention, Emergency Procedures

The CWC preparedness, prevention, and emergency procedures are described in the following subsections. Contingency information is contained in the Building Emergency Plan for CWC, as well as Permit Attachment 4, Hanford Emergency Management Plan. Note: The WRAP has a separate building emergency plan from the CWC.

H.1.4.3.1 Central Waste Complex Building Emergency Plan

CWC is within the Hanford Facility. The Building Emergency Plan for CWC describes facility-specific hazards and emergency planning and response. This site-specific plan is intended to be used in conjunction with Permit Attachment 4, Hanford Emergency Management Plan. If an emergency occurs, the on-call Building Emergency Director will be notified, and the requirements associated with Permit Attachment 4, Hanford Emergency Management Plan, and the CWC Building Emergency Plan will be implemented. A copy of the CWC Building Emergency Plan is kept in the operating record.
H.1.4.3.2 Hanford Emergency Management Plan

H.1.4.4 Facility Recordkeeping

Historical records that describe dangerous and mixed waste management activities within the 2401-W Building are retained in the operating record, which ensures proper availability and retention periods. These records describe the source of the chemicals, quantity, and hazards associated with the chemicals.

Records will be stored in either electronic or hardcopy format. Documentation and records, regardless of medium or format, are controlled in accordance with internal work requirements and processes to ensure the accuracy and retrievability of stored records. Records generated during closure will be maintained in the operating record in accordance with Permit Condition II.I.

H.1.5 Facility Contact Information

2401-W Waste Storage Building Operator and Property Owner:

- Brian T. Vance, Manager
- U.S. Department of Energy, Richland Operations Office
- P.O. Box 550
- Richland, WA 99352
- (509) 376-7395

2401-W Waste Storage Building Co-Operator:

- Scott Sax, President and Project Manager
- Central Plateau Cleanup Company, LLC
- P.O. Box 1464
- Richland, WA 99352
- (509) 372-3845

H.2 Closure Performance Standards

The 2401-W Building will be closed in a manner that complies with the closure performance standards in WAC 173-303-610(2)(a) and (b) and, therefore, achieves clean closure. The objectives of closure activities for the 2401-W Building are as follows:

- Minimize the need for further maintenance.
- Control, minimize, or eliminate to the extent necessary to protect HHE post-closure escape of dangerous waste, dangerous constituents, leachate, contaminated runoff, or dangerous waste decomposition products to the ground, surface water, groundwater, or atmosphere.
- Remove all waste and waste residues.
- Decontaminate the concrete surface to meet the Alternative Treatment Standards for Hazardous Debris (i.e., removal of at least 0.6 cm of the surface layer; treatment to a clean debris surface)
- Perform soil sampling and analysis to ensure soils under the 2401-W Building meet standard Model Toxics Control Act (MTCA) Method A or B cleanup levels, and remove any soils contaminated above these levels.
- Return the land to the appearance and use of surrounding land areas to the degree possible, given the nature of the previous dangerous waste activity.

H.3 Closure Activities

The 2401-W Building will be clean closed.
The following closure activities are required to achieve and certify clean closure:

- Remove all dangerous and mixed waste inventory (completed, Section H.3.1).
- Review dangerous and mixed waste container storage, operating, and inspection records for documented spills or releases of dangerous or mixed waste during periods of waste storage and subsequent cleanup (completed, Section H.3.2).
- Perform initial visual inspection of the floor surfaces to identify dangerous or mixed waste related staining, low points, joints/seams, cracks, holes, pits, or breaches significant enough to allow contamination to reach underlying soil. Evaluate surface to identify potential for focused sample locations (completed, Section H.3.2).
- Remove equipment and material from the 2401-W Building and perform a final visual inspection of the floor to identify dangerous or mixed waste related staining, low points, joints/seams, cracks, holes, pits, or breaches significant enough to allow contamination to reach underlying soil. Evaluate surface to identify potential for additional focused sample locations (Section H.3.4).
- Decontaminate the concrete surface to meet the Alternative Treatment Standards for Hazardous Debris by removing of at least 0.6 cm of the surface layer to a clean debris surface (Section H.3.5).
- Confirm the concrete surface meets closure performance standard of clean debris surface via visual inspection (Section H.3.8 and H.5.1).
- Perform focused soil sampling below the 2401-W Building (Section H.4.4).
- Confirm analytical results from soil samples meet closure performance standards (Section H.3.9).
- Identify and manage contaminated environmental media (Section H.3.6).
- Identify and manage waste generated during closure (Section H.3.7).
- Transmit closure certification to Ecology as in Section H.5.3.

H.3.1 Removal of Wastes and Waste Residues

No dangerous or mixed waste is currently stored at the 2401-W Building. The last dangerous waste was removed in November 2010 from the CAA. The 2401-W Building will not be used for dangerous or mixed waste storage in the future.

It is unknown if dangerous or mixed waste residues are present at this DWMU. If dangerous or mixed waste residues are found during clean closure activities, then such residues will be removed and managed as newly generated waste in accordance with Section H.3.7.

H.3.2 Operating Records Review and Visual Inspection

In 1999, closure of the 2401-W Building was considered. A records review of the 2401-W Building was completed for records covering waste storage from May 1989 to June 1999. There was no sign of dangerous or mixed waste contamination found from the records review. Documentation for the prior closure efforts is included DOE/RL-99-46, 2401-W Waste Storage Building Closure Plan.

To support the development of this closure plan, an additional records review of the CWC-WRAP container storage, operating, and inspection records were completed and submitted to the operating record. The records review included the following operating record documents: facility operating logbooks (including spill reports), waste management inspection records, and surveillance records. The operating records that were reviewed focused on the period during active waste storage for the CWC continuing on from the prior 1999 records review (i.e., June 1999 through December 2000) including:
The records review extended past the active waste storage period to August 2013. The records review indicated no releases of dangerous or mixed waste in the 2401-W Building. Table H-3 provides a summary of the records review for this current closure plan.

</tr>
</tbody>
</table>

DW/MW = Dangerous Waste/Mixed Waste
ID = Identification

For the purposes of focused sampling, a visual inspection was performed by the Permittees for the visible floor surface in the 2401-W Building on August 14, 2013, to identify any dangerous or mixed waste related staining. No dangerous or mixed waste related staining was identified during the visual inspection.

Ecology and the Permittees performed an additional walk down and inspection of the DWMU in November of 2018. Ecology added six focused soil samples at locations where construction joints/seams of the concrete floor intersect. Sample locations are identified in Figure H-7. Section H.4.4.1 provides details on the sample design for the focused soil samples.

Ecology and the Permittees conducted the above inspections without removing stored equipment and non-waste materials. Once all stored equipment and materials have been removed from the 2401-W Building to support sampling and decontamination activities, a final visual inspection will be performed by the Permittees and Ecology (Section H.3.4).
Supporting documentation for the Permittees’ visual inspection is included in Attachment A, CWC 2401-W Building Visual Inspection Documentation.

H.3.3 Unit Components, Parts, and Ancillary Equipment

The 2401-W Building does not have any unit components, parts, or ancillary equipment identified for removal as part of closure. The 2401-W Building will remain in place pending confirmation and acceptance of clean closure.

H.3.4 Inspection of Unit Before Decontamination

Once closure activities begin, all stored equipment and material will be removed from the 2401-W Building. A visual inspection of the floor surface by the Permittees and Ecology will be conducted to identify any dangerous waste or mixed waste related staining, low points, joints/seams, cracks, holes, pits, or breaches significant enough to allow contamination to reach underlying soil. Additional focused sampling will be performed if the final visual inspection identifies areas where waste has a potential avenue to reach the underlying soil. If the need for additional focused soil sampling is so identified, the Permittees will submit a permit modification request to modify the closure plan.

H.3.5 Decontamination

Decontamination of the concrete surface in the 2401-W Building DWMU will be performed by physically extracting at least 0.6 cm (~1/4 in) of the concrete surface layer, to a clean debris surface. A series of cutter blades, impact hammers, rotating grinding wheels, or similar equipment will be used to break up the concrete surface layer. Physical extraction techniques will be performed in accordance with 40 Code of Federal Regulations (CFR) 268.45, Table 1, “Alternative Treatment Standards for Hazardous Debris,” and will include one or more of the following:

- Abrasive blasting.
- Scarification, grinding, and planing.
- Spalling.

Decontamination includes the following steps:

1. Ensure all stored materials and equipment are relocated or removed from the area.
2. If using wet-cutting equipment, seal all significant cracks including expansion joints identified during the visual inspection (Section H.3.4) using an appropriate sealant material.
3. Decontaminate the concrete surface by removing at least 0.6 cm (~1/4 in), to a clean debris surface (as defined in Section H.5.1.1).

Residual material from decontamination activities will be managed as newly generated waste in accordance with Section H.3.7.

Equipment that becomes contaminated during decontamination and sampling activities will be decontaminated for re-use or managed and disposed of as newly generated waste in accordance with Section H.3.7. Decontamination of equipment will generally be performed using dry methods (such as wiping) to the extent possible. A temporary decontamination area may be established near the 2401-W Building. This area will be constructed of Visqueen™ or an equivalent material, and may be used for decontamination of sampling equipment, personal protective equipment, and other miscellaneous small equipment used during decontamination and sampling activities. When decontamination of equipment is completed, the Visqueen™ or equivalent material, rinsate, and solid waste debris generated by equipment decontamination (e.g., rags and personal protective equipment) will be removed and managed as newly generated waste in accordance with Section H.3.7.
H.3.6 Identifying and Managing Contaminated Environmental Media

The records review and initial visual inspection outlined in Section H.3.2 did not identify any releases of dangerous or mixed waste or the presence of staining that could be related to dangerous or mixed waste. Contaminated environmental media (soil) removal is not anticipated. However, contaminated soil will be remediated at the focused sample location(s) where analytical results indicate contamination.

If contamination above closure performance standards is identified, then the nature and extent of contamination will be evaluated. Soil surrounding the focused sampling location will be removed up to 4.6 m (15 ft) below the surface. Contaminated soil will be removed using equipment capable of removing the quantity of material required to complete removal. If contamination exists in the soil deeper than 4.6 m (15 ft), the Permittees will collaborate with Ecology for a path forward on closure. Resulting changes to this closure plan will be submitted to Ecology as a permit modification request in accordance with Permit Condition I.C.3.

Contaminated soil will be removed and managed as a newly generated waste stream. Contaminated soil will be managed in accordance with all applicable requirements of WAC 173-303-170, Requirements for generators of dangerous waste, through 173-303-230, Special conditions. [WAC 173-303-610(5)]

The contaminated soil will be containerized, labeled, and sampled as needed to designate for disposal of the entire volume of contaminated soil. Contaminated soil will be placed in U.S. Department of Transportation-compliant containers and sent to an appropriate land disposal unit, possibly with central accumulation as an intermediary step in accordance with all applicable requirements of WAC 173-303-200, Conditions for exemption for a large quantity generator that accumulates dangerous waste.

Contaminated soil subject to the requirements of WAC 173-303-140, Land disposal restrictions, (which includes by reference 40 CFR 268 Land Disposal Restrictions) will be characterized, designated, and treated, as applicable, prior to disposal in an appropriate land disposal unit.

H.3.7 Identifying and Managing Waste Generated During Closure

Closure activities for the 2401-W Building will result in waste generated during closure activities, requiring management and disposal. A vacuum-equipped system with a high efficiency particulate air filter will remove dust and chips during scarification, grinding, and planing to prevent release of possible contamination. Decontamination will be performed with the door(s) closed and the building ventilation system(s) deactivated to prevent possible releases. Concrete and dust collected during closure activities for the DWMU will be containerized, labeled, and sampled to properly characterize such waste prior to disposal.

Concrete will be removed from the surface layer of the floor to meet the clean debris surface standard; concrete will also be removed to access the underlying soil for focused sampling. The waste will be managed as a newly generated waste stream and either disposed of or decontaminated in accordance with WAC 173-303-610(5).

Newly generated waste will be managed in accordance with all applicable requirements of WAC 173-303-170 through 173-303-230. Once waste characterization results are received, all waste will be designated. Dangerous and mixed waste will be treated, if necessary, to meet land disposal restrictions in WAC 173-303-140 Land disposal restrictions, (which incorporates by reference 40 CFR 268, Land Disposal Restrictions), then ultimately disposed in an appropriate land disposal unit.

Management and disposal of waste generated during closure will be documented and included as part of the clean closure certification documentation (Section H.5.3).

H.3.8 Closure Performance Standards for Concrete and Soil

The following subsections discuss closure performance standards for concrete and soil.
H.3.8.1 Closure Performance Standards for Concrete

For the 2401-W Building, the point of compliance, or location where it is determined that the closure performance standard has been achieved, is the surface of the concrete flooring. On completion of decontamination activities, the 2401-W Building will be visually inspected to verify that the clean debris surface standard has been met (Section H.5.1.1).

H.3.8.2 Closure Performance Standards for Soil

The presumed exposure pathways considered for the 2401-W Waste Storage Building are:

- WAC 173-340-740(3), Model Toxics Control Act—Cleanup, Unrestricted land use soil cleanup standards, Method B (cancer and noncancer), which considers human health based on direct soil contact.
- WAC 173-340-740(2), Table 740-1, “Method A Soil Cleanup Levels for Unrestricted Land Uses” (WAC 173-340-900, Tables), which includes closure performance standards for human health based on unrestricted land use. MTCA Method A is only used if MTCA Method B is not available for a particular contaminant in the Cleanup Levels and Risk Calculation tables.
- WAC 173-340-747, Deriving soil concentrations for groundwater protection, which notes soil concentrations protective of groundwater.
- WAC 173-340-7493, Site-specific terrestrial ecological evaluation procedures, which considers ecological indicators (plants, biota, wildlife) in Table 749-3, “Ecological Indicator Soil Concentrations (mg/kg) for Protection of Terrestrial Plants and Animals” (WAC 173-340-900).
- WAC 173-340-750, Cleanup standards to protect air quality, which describes human health risks due to fugitive vapors and dust.

Of the exposure pathways listed above, direct soil contact is always considered a complete and viable exposure pathway for all soil samples. The exposure pathway for soil protective of groundwater assumes that water or precipitation on a surface has an avenue to percolate through the surface and underlying soil to groundwater. The scenario for ecological indicators requires that vegetation, biota, and wildlife be present in order for the pathway to be complete. The exposure scenario for inhalation of fugitive vapors and dust assumes a complete pathway, which would begin with a source of contaminated media and end with a receptor.

Of the viable exposure pathways, the most conservative closure performance standard is selected. Per WAC 173-340-740(5)(c), the closure performance standard value cannot be below the following:

- Hanford Site background.
- Laboratory practical quantitation limit (PQL) found in the CPCCo laboratory contracts.

If a closure performance standard is below both values, the higher of these two values is selected.

A number of exposure pathways considered from the list above were determined to be incomplete pathways and were excluded when determining closure performance standards. The records review of waste stored in the 2401-W Waste Storage Building indicate no releases (Section H.3.2). Therefore, there is no known waste-related source of contaminated media and the inhalation exposure pathway has been excluded. The concrete floor is within a maintained building where no vegetation is present; therefore, the soil pathway protective of ecological indicators has been excluded. When considering soil levels protective of groundwater, there must be a route of exposure from water or rainwater to the underlying soil. The 2401-W Waste Storage Building is an enclosed structure, with a foundation that is integrated into a perimeter concrete curb 6 in. (15.2 cm) above grade. During operations, the floors (including joints/seams) were coated with an epoxy resin floor surfacing system that was compatible with the stored waste. The Permittees’ visual inspections (Section H.3.2) did not identify dangerous or mixed waste related staining. With no indication of a route of exposure from water or rainwater to the underlying soil,
the soil concentration protective of groundwater pathway was excluded when calculating closure performance standards. The remaining applicable pathway for evaluation of closure performance standards was direct contact with soil which, as noted in the previous paragraph, is always a viable exposure pathway for soil samples.

Soil sampling and analysis will be conducted in accordance with the closure plan Sampling and Analysis Plan (SAP) located in Section H.4. Analytical results of the soil samples will be individually compared to closure performance standards consistent with closure requirements. [WAC 173-303-610(2)(b)(i)]

If target analytes are found above closure performance standards, then the contaminated soil will be remediated and confirmatory sampling will be conducted in accordance with Section H.4.4.3 to ensure the closure performance standards are met for the remaining soil. If failed constituents of concern do not meet closure performance standards after soil remediation, then the Permittees will meet with Ecology to determine a path forward for closure. Resulting changes to this closure plan will be submitted to Ecology as a permit modification request in accordance with Permit Condition I.C.3. The sample design for focused samples is discussed in Section H.4.1.

### H.3.9 Development of Closure Performance Standards for Soil

The target analytes considered for evaluation during closure sampling and analysis were derived from a list of all waste codes identified at other CWC closure DWMUs. Table H-5 provides the closure performance standards for soil for each individual target analyte associated with the dangerous waste codes identified. A list of closure performance standard values for all exposure pathways was provided to Ecology in July 2017 as correspondence from DOE (17-AMRP-0217, “Dangerous Waste Management Unit [DWMU] 277-T Building Closure Plan Comment Disposition, and Performance Standards for Future Solid Waste Operations Complex [SWOC] Closure Plans”), which Ecology acknowledged (17-NWP-100, “Dangerous Waste Management Unit [DWMU] 277-T Building Closure Plan Comment Disposition and Performance Standards for Future Solid Waste Operations Complex [SWOC] Closure Plans”). Values in Table H-5 have been adjusted to remove nonviable pathways as noted above.

ECF-HANFORD-11-0038, Soil Background for Interim Use at the Hanford Site.
Ecology, 2005, Pub. #94-111, Guidance for Clean Closure of Dangerous Waste Units and Facilities. Section 5.6.2 states “…Ecology believes that MTCA unrestricted site use cleanup levels for soil represent very conservative assessments of the potential exposure risks posed by concrete.”
Ecology, 2019, Cleanup Levels and Risk Calculation (CLARC) Data Tables, Toxics Cleanup Program.
Howard et al., 1991, Handbook of Environmental Degradation Rates.
SW-846, Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, Third Edition; Final Update V.
WAC 173-340, Model Toxics Control Act—Cleanup.
173-340-347, Deriving soil concentrations for groundwater protection.

Notes: Screening levels considered when developing closure performance standards were drawn from the following:
- MTCA (WAC 173-340-740, Model Toxics Control Act—Cleanup, Unrestricted land use soil cleanup standards) (Ecology, 2019, Cleanup Levels and Risk Calculation (CLARC) Tables, May 2019 data tables are the most recent). MTCA Method B values represent both cancer and noncancer human health risk values from direct soil contact. The most conservative value of the two Method B published values will be used. Method A values are substituted when MTCA Method B values are not provided in the CLARC tables.
- WAC 173-340-747. Section 4 describes the fixed parameter three-phase partitioning model. Where applicable, these values were used. Values selected were from the 25°C vadose zone. If values were not listed for 25°C, values from the 13°C vadose zone were used.
- Background levels as published in ECF-HANFORD-11-0038, Soil Background for Interim Use at the Hanford Site, and DOE/RL-92-24, Hanford Site Background: Soil Background for Nonradioactive Analytes. Background values were used at the 90th percentile of calculated Hanford background values.
- Closure performance standard values for all exposure pathways were provided to Ecology in July 2017 correspondence from DOE (17-AMRP-0217) and which values Ecology acknowledged (17-NWP-100). Values in this table have been adjusted to remove nonviable pathways.
- Values taken from the above resources that fell below background levels were not considered.

aMany of the chemicals listed in this table also have P and U waste codes associated with them (WAC 173-303-9903, Discarded chemical products list). (1) These codes are listed in the table because it is unknown whether or not the waste container had a “discarded chemical product” (per WAC 173-303-081) or if it was a chemical contaminant of the waste. (2) The P and U code designations do play a part in the determination of dangerous waste criteria (WAC 173-303-100), as they indicate that chemical as either acutely hazardous (P) or dangerous (U) waste based on toxicity and/or persistence calculations. For these reasons, the P and U codes are listed in parentheses.

bHighest allowable PQL will be defined in the individual laboratory contract with CPCCo. In practice, the laboratory PQL values have the potential to be lower.

cAccuracy criteria for associated batch matrix spike percent recoveries. Evaluation based on statistical control of laboratory control samples is also performed. Precision criteria for batch laboratory replicate matrix spike analyses or replicate sample analysis.

dPrecision is determined by the laboratory based on historical data or statistically derived control limits. Limits are reported with the data. Where specific acceptance criteria are listed, those acceptance criteria may be used in place of statistically derived acceptance criteria.

eArsenic – the Hanford Site closure performance standard is 20 mg/kg based (Ecology, 2013), indicating that the Method A soil closure performance standard of 20 mg/kg can be used to define natural background levels when developing Method B soil closure performance standards for the Hanford Site. One of the two methods (SW-846 6010 or 6020) may be used.

fMercury – Equation 740-1 and Equation 740-2 from WAC 173-340-740(3)(b) are used to calculate the MTCA Direct Contact Human Health soil closure performance standards. The MTCA human health direct contact soil closure performance standard for mercury is calculated to be 24 mg/kg.

gCresols – the closure performance standard for o-cresol will be reported as total cresols: a total of the three isomeric forms: o-cresol, m-cresol, and p-cresol.

hCyanides – Copper (P029), potassium (P098), and sodium cyanides (P106), as well as other cyanide salts not specified will be analyzed as total cyanide.

iAcetaldehyde and 2-nitropropane are listed with inhalation values in the CLARC Tables. However, because the inhalation pathway is not being addressed as part of this closure plan, they will not be analyzed.

jAcetyl chloride, MEK peroxide, and phosphorus pentasulfide are not listed in the CLARC Tables. They would most likely be inhalation hazards if present (based on NIOSH chemical hazard data), so they are not being calculated as closure performance standards and will not be analyzed.

kChloroacetaldehyde – No previous records of analysis on the Hanford Site. CAS is not listed in CLARC tables. Chloroacetaldehyde is not listed in the CLARC Tables. It would most likely be an inhalation hazard if present, so it is not being calculated as a closure performance standard and will not be analyzed.

l2-Ethoxyethanol – Due to the extremely short half-life of 2-ethoxyethanol (between 168 and 672 hours), its presence in soil samples is highly unlikely; therefore, samples will not be analyzed for this constituent. Degradation rates from Howard et al., 1991, p. 420.

mA CFC is an organic compound that contains only carbon, chlorine, and fluorine, produced as a volatile derivative of methane, ethane, and propane. Examples of CFCs include 1,1,2-trichloro-1,2,2-trifluoroethane (CFC-133) and trifluoromethane (CFC-11).

CAS = Chemical Abstracts Service  MTCA = Model Toxics Control Act–Cleanup
CFC = Chlorofluorocarbon  N/A = Not applicable
CLARC = Cleanup Levels and Risk Calculation  PQL = Practical quantitation limit
CPCCo = Central Plateau Cleanup Company, LLC  RPD = Relative percent difference

Addendum H.26
H.3.10 Conditions That Will be Achieved When Closure is Complete

Upon completion of the closure activities, the 2401-W Building will remain in an “as-is” state with the building remaining in place. The 2401-W Building will continue to be used for equipment and material storage in support of CWC-WRAP operations. Once Ecology accepts the clean closure certification, a permit modification request will be submitted to remove the 2401-W Building DWMU closure requirements from the Permit.

H.4 Sampling and Analysis Plan

Sampling and analysis of the soil below the 2401-W Building will be conducted to confirm whether closure performance standards for soil have been met. Sampling includes six focused soil samples (Figure H-7). Sampling and analysis will be performed in accordance with the sampling and quality standards established in this closure SAP.

H.4.1 Sampling and Analysis Plan Requirements

Sampling and analysis activities were designed using the EPA guidance document EPA/240/R-02/005, Guidance on Choosing a Sampling Design for Environmental Data Collection for Use in Developing a Quality Assurance Project Plan (EPA QA/G-5S) and Ecology Publication #94-111, and will be conducted via this SAP. The objective of the soil sampling described in this section is to determine if the closure performance standards (Table H-5) established in this closure plan pursuant to WAC 173-303-610(2)(b)(i) and WAC 173-303-610(2)(b)(ii) have been satisfied, demonstrating clean closure for the 2401-W Building.

The closure SAP details sampling and analysis procedures in accordance with SW-846, Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, Third Edition; Final Update V; the American Society for Testing and Materials (ASTM) Annual Book of ASTM Standards (ASTM International, 2017); and applicable EPA guidance. Sampling and analysis activities will meet applicable requirements of SW-846, ASTM standards, and EPA-approved methods at the time of closure. This SAP was also developed using guidance from Ecology Publication #94-111, Section 7.0, Sampling and Analysis for Clean Closure, and EPA/240/R-02/005.

H.4.2 Sampling and Analysis Schedule

Closure sampling and analysis will be performed in accordance with the closure plan schedule located in Section H.6.

H.4.3 Project Management

The following subsections address project management and ensure that the project has defined goals, participants understand the goals and approaches used, and planned outputs are appropriately documented. Project management roles and responsibilities discussed in this section apply to the major activities covered under this SAP.

H.4.3.1 Project/Task Organization

The Permittees are responsible for planning, coordinating, sampling, preparing, packaging, and shipping samples to the contract analytical laboratory. The project has the following key positions.

Regulatory Representative. Ecology will assign an Ecology employee as Project Manager responsible for oversight of the 2401-W Building closure.

Project Manager and Technical Lead. The CPCCo Project Manager provides oversight of closure activities and coordinates with the DOE, Richland Operations Office (DOE-RL), Ecology, and contract management. In addition, support is provided to the project technical lead to ensure that work is performed safely and cost effectively.
The Project Manager (or designee) for the 2401-W Building closure sampling is responsible for direct management of sampling documents and requirements, field activities, and subcontracted tasks. The Project Manager is responsible for ensuring that project personnel are working to the approved version of the 2401-W Building Closure Plan in the Permit and for providing updates to field personnel.

The Project Manager works closely with QA, Health and Safety, and the Field Work Supervisor (FWS) to integrate these and other lead disciplines in planning and implementing the work scope. The Project Manager also coordinates with DOE-RL and the primary contractor management on all sampling activities. The Project Manager supports DOE-RL in coordinating sampling activities with the Regulatory Representative.

**Environmental Compliance Officer.** The Environmental Compliance Officer provides technical oversight, direction, and acceptance of project and subcontracted environmental work, and develops appropriate mitigation measures with a goal of minimizing adverse environmental impacts.

**Health and Safety.** The Health and Safety organization is responsible for coordinating industrial safety and health support within the project, as carried out through health and safety plans, job hazard analyses, and other pertinent safety documents required by federal regulation or internal primary contractor work requirements.

**Waste Management Lead.** The Waste Management Lead communicates policies and protocols, and ensures project compliance for storage, transportation, disposal, and waste tracking.

**Field Work Supervisor.** The FWS is responsible for planning and coordinating field sampling resources. The FWS ensures that samplers are appropriately trained and available. Additional related responsibilities include ensuring that the sampling design is achievable, understood, and can be performed as specified.

The FWS must document all deviations from procedures or other problems pertaining to sample collection, chain-of-custody (COC) protocols, analytes, sample analysis, sample transport, or noncompliant monitoring. As appropriate, such deviations or problems will be documented in the field logbook or in nonconformance report forms in accordance with internal corrective action procedures. The FWS is responsible for communicating field corrective actions to the Project Manager and for ensuring that immediate corrective actions are applied to field activities.

**Sample Management and Reporting.** The Permittee’s sampling organization coordinates field sampling as well as laboratory analytical work, ensuring that laboratories conform to the specifications of SW-846 analytical methodology at the time of closure. The sampling organization receives the analytical data from the laboratories, performs the data entry into the Hanford Environmental Information System (HEIS) database, and arranges for data validation. The sampling organization is responsible for informing the Project Manager of any issues reported by the contract analytical laboratory.

**Contract Laboratories.** The contract laboratories analyze samples in accordance with established procedures and provide necessary sample reports and explanation of results in support of data validation. The roles described above make up the project organization structure (regarding sampling and analysis) and interact in a manner shown graphically in Figure H-6.
H.4.3.2 Field Sampler Training/Certification

Training records of field samplers are maintained by the sampling organization, retained in the electronic training record database, or archived with operating records. Field samplers will be collecting grab samples of the soil beneath the concrete floor for analysis to determine if soil closure performance standards have been met.

H.4.3.3 Sampling Documents and Records

The Project Manager is responsible for ensuring that the current version of the SAP is being used and providing any updates to field personnel. Version control is maintained by the administrative document control process. Changes to the SAP affecting the data needs will be submitted as a permit modification request.

Logbooks are required for field activities. A logbook must be identified with a unique project name and number. The individual(s) responsible for logbooks will be identified in the front of the logbook and only authorized persons may make entries in logbooks. After review, logbooks will be signed by the field manager, supervisor, cognizant scientist/engineer, or other responsible individual. Logbooks will be permanently bound, waterproof, and ruled with sequentially numbered pages. Pages will not be removed from logbooks for any reason. Entries will be made in indelible ink. Corrections will be made by marking through the erroneous data with a single line, entering the correct data, and initialing and dating the changes.

The Project Manager is responsible for ensuring that a project file is properly maintained. The project file will contain the records or references to their storage locations. The following items will be included in the project file, as appropriate:

- Field logbooks or operational records.
- Global positioning system data.
Sample authorization forms.
Data forms.
COC forms.
Sample receipt records.
Inspection or assessment reports and corrective action reports.
Interim progress reports.
Final reports.
Laboratory data packages.
Data verification and validation reports.

The contract analytical laboratory is responsible for maintaining, and having available upon request, the following items:

- Analytical logbooks.
- Raw data and Quality Control (QC) sample records.
- Standard reference material or proficiency test sample data.
- Instrument calibration information.

Records will be stored in accordance with Section H.1.4.4.

**H.4.4 Sampling Design and Analysis**

The sampling design includes input parameters used to determine the number and location of samples.

The primary purpose of sampling the soil is to determine if analytical results meet closure performance standards (Table H-5).

**H.4.4.1 Sampling Process Design**

This SAP is based on guidance from Ecology Publication #94-111, Section 7.0, to determine the type of sampling design that will be used to demonstrate clean closure. When designing the sampling plan, focused sampling methods were considered. The basis for sampling is described in the following paragraphs.

**Focused (Judgmental) Sampling.** As identified in Ecology Publication #94-111, Section 7.2.2, Focused Sampling, this method is selective sampling of areas where contamination is expected or releases have been documented.

Focused sampling should be conducted in addition to grid sampling where there is evidence of leaks or spills or potential for a dangerous waste constituent to migrate. Focused sampling could involve liner sampling along a drainage-way, boundary, or other linear dimension. Likely areas for focused sampling include, but are not limited to:

- Containers, tanks, waste piles, or any other units (such as ancillary pipes) in contact with soil;
- Below any sumps or valves;
- Load or unload areas;
- Storage units with underlying pavements or concrete that appears to be cracked or broken; and
- Areas receiving runoff or discharge from DWMUs, such as a ditch, a swale, or the discharge point down gradient from a pipe.
Evidence for additional areas of focused sampling could include:

- Visual or olfactory evidence of contamination including evidence based on direct reading field instrumentation or field test kits;
- Knowledge, such as reports by employees, inspectors, or others that releases have or may have occurred;
- Length of time the unit has been in existence;
- Entries into the unit operating record; and
- Soil gas surveys or soil borings.

Per Ecology’s visual inspection (Section H.3.2) and Ecology’s professional judgment, six focused sample locations are identified for the soil beneath the 2401-W Building (Figure H-7).

The intersections where two construction joints/seams meet are considered possible avenues for waste to migrate to the soil below the concrete; therefore, these locations were identified for focused soil sampling.

Selection of focused sampling units (i.e., the number and location of samples) is generally based on knowledge of the feature or condition under investigation and on professional judgment. Focused sampling is distinguished from probability-based sampling in that inferences are based on professional judgment, not statistical scientific theory. Therefore, conclusions about the target population are limited and depend entirely on the validity and accuracy of professional judgment.

The use of statistical evaluation for focused data is not possible. Any focused data must be reviewed directly against the closure performance standards as to whether they are above or below the standards.

**Figure H-7 Sampling Locations**
**H.4.4.2 Sampling Methods and Handling**

The grab sample matrix will consist of soil collected in clean sample containers. Soil will be collected at a depth of no more than 15 cm (6 in.) below ground surface, unless staining or discoloration indicates contamination is below that depth. For the purpose of this SAP, ground surface is defined as the exposed surface layer once concrete has been removed. Once the soil is collected, the sampled media will be screened to remove material larger than approximately 2 mm (0.08 in.) in diameter, which allows for a larger surface area-to-volume ratio. This ratio increases the likelihood of identifying any potential contamination in the sample.

To ensure sample and data usability, sampling will be performed in accordance with established sampling practices, procedures, and requirements pertaining to sample collection, collection equipment, and sample handling. Sampling includes the following:

- Preparation and review of sampling paperwork such as COC or labels.
- Sample container and equipment preparation.
- Field walk down of sample area (includes locating and marking sample locations).
- Sample collection.
- Sample packaging and shipping.

Sample preservation and holding time requirements are specified in Table H-6. These requirements are in accordance with the analytical method specified. The final container type and volumes will be identified on the sampling authorization form and the COC form.

Holding times are from sampling to analysis unless specified otherwise.

AES = Atomic emission spectrometry
EPA = U.S. Environmental Protection Agency
ICP = Inductively coupled plasma
MS = Mass spectrometry
GC = Gas chromatography
G/P = Glass/plastic

A sampling and data-tracking database (e.g., HEIS) is used to track the samples from the point of collection through the laboratory analysis process. HEIS sample numbers are issued to the sampling organization for the project. Each sample is identified and labeled with a unique HEIS sample number.

To prevent potential contamination of the samples, clean equipment will be used for each sampling activity. Equipment used during sampling will be decontaminated or disposed of and managed as newly generated waste in accordance with Section H.3.6. Level I EPA pre-cleaned sample containers will be used for samples collected for chemical analysis. Container sizes may vary, depending on laboratory-specific volumes/requirements for meeting the PQL.

The date and time of sample collection, and the sample location, depth, and corresponding HEIS numbers will be documented in the sampler’s field logbook. A custody seal (e.g., evidence tape) will be affixed to each sample container (except for Volatile Organic Analysis [VOA] sample containers) or the sample collection package in such a way as to indicate potential tampering. The custody seal will be inscribed with the sampler’s initials and date. Custody tape is not applied directly to VOA sample containers based on the potential for affecting analyte results or fouling of laboratory equipment. Alternatively, VOA vials are placed in a sealable plastic bag affixed with custody seals and any other required labels/documentation.

Data verification and validation will also note any issues with sample collection and analysis. Each sample container will be labeled with the following information on firmly affixed, water-resistant labels:

- Sample authorization form and form number.
- HEIS number.
- Sample collection date and time.
- Sampler identification (e.g., initials).
- Analysis required.
- Preservation method (if applicable).
- COC identification number.

In addition to the container label information, sample records must include:

- Sample location.
- Matrix (e.g., soil).

Sample custody will be maintained in accordance with existing Hanford Facility protocols to ensure maintenance of sample integrity throughout the analytical process. COC protocols will be followed throughout sample collection, transfer, analysis, and disposal to ensure that sample integrity is maintained. A COC record is initiated in the field at the time of sampling and will accompany each set of samples shipped to any laboratory. At a minimum, the following information must be identified on a completed COC record:
Collector(s) names.
Project designation.
Unique sample numbers.
Date, time, and location (or traceable reference thereto) of sample collection.
Chain of possession information (i.e., signatures/printed names of all individuals involved in the transfer of sample custody and storage locations, dates of receipt and relinquishment).

Additional information regarding the sample and specific analytical instructions may also be documented. Discrepancies with the sample material (unusual color, texture, or odor), collection techniques, containers, or transfer packages are noted in the field logbook, communicated with the Project Manager, and corrective actions are initiated. For example, where a custody seal is damaged or missing, each case is individually reviewed for usability of the sample. The damaged or missing seal and action taken will be documented in the final data package. Data verification and validation will also note any issues with sample collection and analysis.

Contaminated environmental media and newly generated waste resulting from sampling activities will be handled in accordance with all applicable requirements of WAC 173-303-170 through WAC 173-303-230 as outlined in Sections H.3.6 and H.3.7.

**H.4.4.3 Sampling and Analysis Requirements to Address Removal of Contaminated Soil**
If focused soil sample results based on direct comparison (Section H.4.4.1) indicate contamination above closure performance standards, then sample location(s) will be remediated to remove contaminated soil. Following remediation, confirmatory sampling will be performed in accordance with this closure SAP. Analytical results of confirmatory sample(s) collected at focused sample location(s) will be directly compared to the closure performance standards to confirm remediation efforts were effective and the area is clean. If after remediation the soil does not meet closure performance standards, then the Permittees will meet with Ecology to determine a path forward for closure. Resulting changes to this closure plan will be submitted to Ecology as a permit modification request in accordance with Permit Condition I.C.3.

**H.4.4.4 Analytical Methods**
All analyses and testing will be performed consistent with this closure plan, laboratory contracts, and laboratory analytical procedures at the time of closure. The contracted analytical laboratory must achieve the lowest PQLs consistent with the selected analytical method (identified in Table H-5) in order to confirm that the closure performance standards are met.

**H.4.4.5 Quality Control**
QC procedures must be followed in the field and laboratory to ensure that reliable data are obtained. Field QC samples will be collected to evaluate the potential for cross-contamination and provide information pertinent to field sampling variability. Field QC samples include the collection of:
- Field trip blanks.
- Field transfer blanks.
- Equipment rinsate blanks.
- Field duplicates.
Laboratory QC samples estimate the precision and bias of the analytical data. Laboratory QC samples include:
- Method blanks.
- Laboratory duplicates.
1. Matrix spikes.
2. Matrix spike duplicates.
4. Laboratory control samples.

Field and laboratory QC samples are summarized in Table H-7.

**Table H-7 Project Quality Control Sampling Summary**

*Batching across projects is allowed for similar matrices.*
H.4.5 Data Review, Verification, Validation, and Usability Requirements

Analytical results will be received from the contract analytical laboratory, loaded into a database (e.g., HEIS), and verified in accordance with Section H.4.5.1. A total of 5% of the data will be validated as described in Section H.4.5.2. A data quality assessment (DQA) will be conducted to ensure the output of the DQO process provided appropriate values (Section H.4.5.3).

H.4.5.1 Data Verification

Verification activities ensure analytical data in the database were properly uploaded and reflect the contract laboratory program equivalent data packages. The steps outlined below will consider both the primary and QC samples. Activities will include, but are not limited to, the following:

- Amount of data requested matches the amount of data received (number of samples for requested methods of analytes).
- Correct procedures/methods are used.
- Issues with sample collection and analysis are noted.
- Documentation/deliverables are complete.
- Hard copy and electronic versions of the data are identical.
- Data is reasonable based on analytical methodologies.

H.4.5.2 Data Validation

The contract analytical laboratory supplies the equivalent of contract laboratory program analytical data packages intended to support data validation by the third party. These data packages are supported by QC test results and raw data. Data validation includes both primary and QC samples, and considers issues with sample collection and analysis.

Controls are in place to preserve the data sent to the validators, such as allowing only additions to be made, not changes to the raw data. The format and requirements for data validation activities are based on the most current version of EPA-540-R-08-01, National Functional Guidelines for Superfund Organic Methods Data Review (OSWER 9240.1-48), and EPA-540-R-10-011, National Functional Guidelines for Inorganic Superfund Data Review (OSWER 9240.1-51). As defined by the validation guidelines, 5% of the analytical results will undergo Level C validation.

H.4.5.3 Data Quality Assessment

A DQA will be performed on the final data using the guidance in EPA/240/B-06/002, Data Quality Assessment: A Reviewer’s Guide (EPA QA/G-9R), and implementing the specific requirements in Sections H.4.5.1 through H.4.5.2.

H.4.6 Revisions to the Sampling and Analysis Plan and Constituents to be Analyzed

Changes to the SAP may be necessary due to unexpected events during closure. An unexpected event would be an event outside the scope of the SAP or a condition that inhibits implementation of the SAP as written. Revisions to the SAP will be submitted no later than 30 days after the unexpected event as a permit modification request. [WAC 173-303-610(3)(b)]

H.5 Confirmation and Certification of Closure Activities

Confirmation of closure will be performed using methods defined in Section H.5.1. Closure certification is performed by an Independent Qualified Registered Professional Engineer (IQRPE) (Section H.5.2). Certification will be submitted to Ecology as described in Section H.5.3, and the conditions of the DWMU after closure are described in Section H.3.10. The 2401-W Building will remain intact after closure. The timing of closure is described in Section H.6.
H.5.1 Confirmation of Clean Closure

The 2401-W Building will be clean closed through confirmation of successful decontamination of the concrete by removing at least 0.6 cm (~1/4 in.) of the surface to a clean debris surface (Section H.5.1.1); and confirmation that samples of the underlying soil meet soil closure performance standards (Table H-5).

H.5.1.1 Confirmation of Clean Debris Surface

On completion of decontamination of the concrete surface, the area will be visually inspected to verify whether the clean debris surface standard, as defined below, has been met.

The following definition of a “clean debris surface” standard is identified in 40 CFR 268.45, Table 1, footnote 3:

“Clean debris surface” means the surface, when viewed without magnification, shall be free of all visible contaminated soil and hazardous waste except that residual staining from soil and waste consisting of light shadows, slight streaks, or minor discolorations, and soil and waste in cracks, crevices, and pits may be present provided that such staining and waste in cracks, crevices, and pits shall be limited to no more than 5% of each square inch of surface area.

This confirmation step will be documented. Documentation may include photos, locations and dimensions of residual staining or waste remaining, cracks, crevices, or pits (if any). Staining or waste remaining on the surface should be calculated to confirm whether the impacted area is less than 5% of the surface. Once it has been determined that the clean debris surface standard has been met, then the concrete surfaces shall have achieved the closure performance standard for concrete, and that portion of 2401-W Building will be considered clean.

If a clean debris surface is not achieved for the concrete surfaces after initial treatment the Permittees will continue to remove additional layers of concrete to achieve a clean debris surface. If a clean debris surface cannot be achieved then the Permittees will meet with Ecology to determine a path forward for closure. Resulting changes to this closure plan will be submitted to Ecology as a permit modification request in accordance with Permit Condition I.C.3.

H.5.1.2 Confirmation of Soil Sample Results

Soil sample results from the contract analytical laboratory will be reviewed to confirm that target analytes have met closure performance standards (Table H-5). Once it has been determined that soil sample results have met closure performance standards, then the soil beneath the 2401-W Building will be considered clean.

Once clean closure has been confirmed for the 2401-W Waste Storage Building DWMU, a closure certification will be prepared in accordance with Section H.5.3.

H.5.2 Role of the Independent Qualified Registered Professional Engineer

An IQRPE will be retained to provide certification of the closure as required by WAC 173-303-610(6). The IQRPE will be responsible for observing field activities and reviewing documents associated with clean closure of the 2401-W Building. At a minimum, the following field activities will be completed:

- Observe and/or review equipment removal activities and disposition records.
- Review 2401-W Waste Storage Building visual inspection documentation.
- Observe and/or review decontamination of the 2401-W Building concrete surface.
- Verify that the concrete surface meets the clean debris surface standard.
- Verify the locations of soil samples are as specified in the SAP.
- Observe and/or review soil sampling activities.
- Review sampling procedures and results.
- Observe and/or review contaminated environmental media removal (as applicable).
- Observe and/or review newly generated waste management and disposition records.
- Verify that closure activities were performed in accordance with this closure plan.

The IQRPE will record observations and reviews in a written report that will be retained in the operating record. The resulting report will be used to develop the clean closure certification, which will then be submitted to Ecology.

H.5.3 Closure Certification

Within 60 days of completion of closure of the 2401-W Building DWMU, a certification that the DWMU has been closed in accordance with the specifications in this closure plan will be submitted to Ecology by registered mail or other means that establish proof of receipt (including applicable electronic means). The certification will be signed by the Permittees and by the IQRPE.

At the time of the closure certification submittal, the Permittees will submit to Ecology information to support the closure certification. [WAC 173-303-610(6)]

The supporting information will include at least the following:
- All field notes and photographs related to closure activities.
- A description of any minor deviations from this closure plan and justification for these deviations.
- Documentation of the removal and final disposition of any unanticipated contaminated environmental media.
- Documentation of the removal and final disposition of any newly generated waste.
- All laboratory and/or field data, including sampling procedures, sampling locations, QA/QC samples, and COC procedures for all samples and measurements, including samples and measurements taken to determine background conditions and determine or confirm clean closure.
- A summary report that identifies and describes the data reviewed by the IQRPE, and tabulation of the analytical results of samples taken to determine and confirm clean closure performance standards were met.
- Description of the 2401-W Building DWMU appearance at completion of closure, including what parts of the former unit, if any, will remain after closure.

H.6 Closure Schedule and Time Frame

Closure activities will be completed no more than 180 days after the effective date of the approved permit modification incorporating this closure plan. [WAC 173-303-610(4)(b)]

Should an unexpected event occur and an extension to the 180-day closure activity expiration date be deemed necessary, a permit modification request will be submitted to Ecology for approval at least 30 days prior to expiration of the 180 days. [WAC 173-303-610(4)(c)]

The permit modification request will include the statement that closure activities, will of necessity, take longer than 180 days to complete, and the supporting basis for the statement. The permit modification request will also include necessary information demonstrating that all steps to prevent threats to HHE have been and will continue to be taken, including compliance with all applicable permit requirements. [WAC 173-303-610(4)(b)]

The closure certification will be submitted to Ecology within 60 days following completion of closure activities at the 2401-W Building DWMU (Table H-8 and Figure H-8).

ATTACHMENT A
CWC 2401-W BUILDING VISUAL INSPECTION DOCUMENTATION
This page intentionally left blank.
CWC, 2401-W BUILDING

Purpose:

A visual inspection walkthrough of the CWC 2401-W Building to determine if there is any evidence of spills and/or leaks from waste packages containing dangerous that were and are stored at this location. The inspection was to identify and document by photographing any waste related staining of the storage area surface (i.e., concrete floor), and to denote any remaining waste related items.

The inspection was performed on August 14, 2013, by Brett M. Barnes, Environmental Compliance Officer (CHPRC).

Results:

No staining of any kind was identified on the storage area surface.

Housekeeping will be performed on the area prior to closure and the debris material will be removed.
