

**WASTE TREATMENT AND IMMOBILIZATION PLANT  
CHAPTER 3B  
QUALITY ASSURANCE PROJECT PLAN FOR THE WASTE ANALYSIS PLAN  
CHANGE CONTROL LOG**

Change Control Logs ensure that changes to this unit are performed in a methodical, controlled, coordinated, and transparent manner. Each unit addendum will have its own change control log with a modification history table. The “**Modification Number**” represents Ecology’s method for tracking the different versions of the permit. This log will serve as an up to date record of modifications and version history of the unit.

Modification History Table

1 **3B.1 INTRODUCTION**

2 This Quality Assurance Project Plan (herein referred to as “this QAPjP”) supports the sampling and  
3 analysis to be implemented by the Hanford Tank Waste Treatment and Immobilization Plant (WTP),  
4 particularly in support of the characterization of the waste feed and the characterization of secondary  
5 waste streams. This QAPjP will ensure that the quality and quantity of data resulting from these sampling  
6 and analysis activities can support the decision-making process for the management of WTP wastes. This  
7 QAPjP was prepared using guidance provided in the following references:

- 8 • *Guidance for Quality Assurance Project Plans* (Environmental Protection Agency [EPA] EPA  
9 QA/G-5, EPA/240/R-02/009).
- 10 • *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods*, SW-846.
- 11 • 24590-WTP-QAM-QA-06-001, *Quality Assurance Manual* (herein referred to as QAM).
- 12 • 24590-WTP-QAM-RAQA-QA-0001, *Commissioning and Operations Quality Assurance*  
13 *Manual*.

14 Quality Assurance (QA) and Quality Control (QC) ensure that an activity or project meets a required  
15 quality standard. QA is associated with record keeping, tracking, audits, and assessments, and it involves  
16 determining the desired level of quality, setting limits in advance, and documenting any anomalies. QC is  
17 associated with the controls implemented while an activity is being performed. This QAPjP complies with  
18 the applicable requirements of the QAM and becomes effective at the commencement of laboratory  
19 operations.

20 The QAPjP will be maintained in the Unit Specific Operating Record.

21 **3B.2 PROJECT DESCRIPTION**

22 The U.S. Department of Energy (USDOE) will select an alternate contractor to operate the WTP. The  
23 WTP will store and treat mixed waste currently stored in the Hanford Double-Shell Tank (DST) System  
24 unit, operated by the Tank Operations Contractor. The WTP has been designed to operate under two  
25 operating configurations. In the baseline configuration, DST waste will first be processed through the  
26 WTP Pretreatment (PT) Facility, and then sent on for vitrification at the Low-Activity Waste (LAW)  
27 Facility and the High-Level Waste (HLW) Facility.

28 The WTP will commence initial operations by processing waste pretreated by the Tank Operations  
29 Contractor and fed directly to the LAW Facility. This configuration is referred to as Direct Feed  
30 Low-Activity Waste (DFLAW) configuration. In this configuration, the LAW Facility and Analytical  
31 Radiological Laboratory (Lab) will be commissioned to operate while the PT Facility and HLW Facility  
32 construction is completed. Upon the completion of construction and successful commissioning of the PT  
33 and HLW facilities, the WTP will switch to the baseline configuration. The portion of DST waste not  
34 subject to direct feed processing (e.g., not pretreated before transferred to WTP) will be treated in the  
35 baseline configuration with the PT, LAW, and HLW facilities. The Tank Operations Contractor will  
36 conduct sampling and facilitate shipment for analysis and will provide results to the WTP for assessment  
37 against the waste acceptance criteria prior to waste receipt at the WTP. The WTP’s secondary waste will  
38 also be sampled and analyzed if process knowledge is insufficient to properly designate the secondary  
39 waste. Analysis of samples for regulatory compliance purposes will be performed by a qualified  
40 outsourced analytical laboratory subject to the provisions of this QAPjP.

### 1 **3B.3 CHARACTERIZATION OF THE WASTE FEED**

2 Chapter 3A, “Waste Analysis Plan for the Baseline Configuration” (Baseline WAP), and Chapter 3C,  
3 “Waste Analysis Plan for the DFLAW Configuration” (DFLAW WAP), identify the sampling locations  
4 and associated constituents for characterization of the waste feed. Waste acceptance criteria for  
5 regulatory characterization are to be met prior to waste processing by the WTP. The waste  
6 characterization parameters for the Baseline configuration are as follows:

- 7 • Total organic carbon.
- 8 • Polychlorinated biphenyls (PCB).
- 9 • pH.
- 10 • Compatibility.
- 11 • Resource Conservation and Recovery Act (RCRA) metals.
- 12 • Mercury.
- 13 • Selected organic compounds.
- 14 • Selected anions.
- 15 • Ammonia.
- 16 • Cyanide.

17 The waste characterization parameters for the DFLAW configuration are as follows:

- 18 • TOC.
- 19 • PCB.
- 20 • pH.
- 21 • Compatibility.
- 22 • RCRA metals.
- 23 • Mercury.
- 24 • Selected anions.
- 25 • Ammonia.

26 The waste acceptance criteria for regulatory characterization of the waste feed for the Baseline  
27 configuration are described in 24590-WTP-RPT-MGT-04-001, Rev. 0, *Regulatory Data Quality*  
28 *Objectives Optimization Report*<sup>1</sup> (RDQO Optimization Report). The waste acceptance criteria for  
29 regulatory characterization of the waste feed for the DFLAW configuration are described in  
30 24590-LAW-RPT-PENG-16-003, *Integrated DFLAW Feed Qualification Data Quality Objects*  
31 (DFLAW DQO Report). These reports describe the constituents of regulatory concern and analytical  
32 methods appropriate for the characterization of the waste feed. The DQO Reports are designed to address  
33 the regulatory needs of the WTP and will be re-evaluated as a result of the environmental risk assessment,  
34 which is currently under development. The Pre-Demonstration Test Risk Assessment (24590-WTP-RPT-  
35 ENV-18-001) has been completed. The final risk assessment will be completed following the  
36 Environmental Performance Demonstration Test (EPDT). The RDQO Optimization Report and the  
37 DFLAW DQO Report’s processes are subject to periodic evaluation and may affect the list of analytes,  
38 selection of analytical methods, and associated QA/QC requirements.

---

<sup>1</sup>The RDQO Optimization Report, Section 9.6, Quality Assurance, specifies compliance with American Society of Mechanical Engineers (ASME) NQA-1-1989; however, the QAM updates this requirement and requires compliance with ASME NQA-1-2000, *Quality Assurance Requirements for Nuclear Facility Applications*.

1 **3B.4 PROJECT MANAGEMENT**

2 This section of the QAPjP addresses the following requirements:

- 3 • Project organization and responsibility.
- 4 • Special training requirements.
- 5 • Documentation and records.
- 6 • Standard operating procedures.

7 **3B.4.1 Project Organization and Responsibility**

8 The Manager of Quality reports directly to the WTP Project Director. The Manager of Quality  
9 (or designee) will provide independent QA oversight to ensure that on-site and subcontracted sampling  
10 and analytical laboratory activities are performed in accordance with this QAPjP.

11 The Nuclear Facility Managers (or designees), supported by the Lab Technical Point of Contact, will  
12 coordinate the execution of sampling and analysis activities in their respective facilities and ensure  
13 compliance with this QAPjP.

14 The Lab Technical Point of Contact will coordinate with the Tank Operations Contractor to arrange for  
15 any required collection of tank waste samples, their packaging, and shipment to the analytical facility,  
16 including ensuring the requirements of this QAPjP, as they apply, are implemented by the Tank  
17 Operations Contractor. The Lab Technical Point of Contact will ensure that analysis is conducted in  
18 accordance with this QAPjP, will oversee the WTP on-site laboratory, and will be responsible for the  
19 coordination and technical oversight of any subcontracted analytical laboratory activities are being  
20 performed in accordance with this QAPjP.

21 Subcontracted analytical laboratory managers will be responsible for ensuring that this QAPjP is  
22 implemented in their respective laboratories.

23 **3B.4.2 Documentation and Records**

24 This section presents the requirements associated with the development, management, and distribution of  
25 waste characterization data and documents.

26 **3B.4.2.1 Documentation and Records Procedures**

27 Documents and records developed as part of the waste analysis program will be generated, reviewed,  
28 approved, distributed, used, controlled, and revised in accordance with approved procedures. These  
29 procedures will comply with applicable requirements of the QAM.

30 Organizations that generate or use data in an electronic format are responsible for complying with  
31 applicable software quality requirements specified in the QAM to ensure that data input (and changes to  
32 data input) is complete and accurate, and that security and integrity of the data is maintained.

33 **3B.4.2.2 Document and Records Storage**

34 Documents and records will be stored and maintained according to approved procedures consistent with  
35 applicable requirements of the QAM. These documents and records will include, but will not be limited  
36 to, the following:

- 37 • Training.
- 38 • Data report packages.
  - 39 • Chain-of-custody forms.
  - 40 • Sampling methods.
  - 41 • Sampling conditions.

- 1 • Sample descriptions.
- 2 • Sample management records.
- 3 • Analytical methods.
- 4 • Data summary reports.
- 5 • QA/QC reports.
- 6 • Assessment reports (including non-conformance and deficiency reports).
- 7 • Analytical instrument inspection, maintenance, and calibration logs.
- 8 • Records and results of waste analysis, specifically the following:
  - 9 • Waste profiles.
  - 10 • Land Disposal Restrictions evaluation.
  - 11 • Notification of waste acceptance.
  - 12 • Notification of waste nonconformance.
  - 13 • Corrective actions.
  - 14 • Waste feed characterization.
  - 15 • Secondary waste characterization.

### 16 **3B.4.3 Technical Operating Procedures**

17 Standard operating procedures for waste sampling and analysis will be developed after the system design  
18 has been completed and before waste is received for processing. Standard operating procedures will be  
19 developed, implemented, and controlled in accordance with applicable requirements of the QAM.

## 20 **3B.5 QUALITY OBJECTIVES AND CRITERIA FOR MEASUREMENT DATA**

### 21 **3B.5.1 Data Quality Objectives**

22 The data quality objectives for the WTP and for the characterization of the Hanford tank waste are  
23 addressed in the following subsections. Where analytical methods or standards are referenced, the most  
24 current acceptable version of each will be implemented.

#### 25 **3B.5.1.1 Data Quality Objectives for the Waste Treatment Plant**

26 Using the data quality objectives process ensures that the data collected are of adequate quality and  
27 quantity to support the decision-making process.

#### 28 **3B.5.1.2 Regulatory Data Quality Objectives Optimization for Hanford Tank Waste** 29 **Characterization**

30 Characterization of the Hanford waste feed will be performed in conformance with the process in the  
31 RDQO Optimization Report for the Baseline configuration and the DFLAW DQO Report for the  
32 DFLAW configuration. These processes establish sample preparation and analytical methods suitable for  
33 determining the concentration of selected constituents of concern at Method Detection Limits (MDL)  
34 sufficient for regulatory requirements. The DQO process is an ongoing activity and may affect the set of  
35 analytes and analytical methods, and associated QA/QC requirements.

### 36 **3B.5.2 Data Quality Indicators**

37 This section discusses the following data quality indicators:

- 38 • Analytical measurement accuracy.
- 39 • Analytical precision.
- 40 • Representativeness.

1 **3B.5.2.1 Analytical Measurement Accuracy**

2 Accuracy can be estimated by calculating the percentage recovery of laboratory matrix spike samples  
3 using the following equation, described in *Preparation Aids for the Development of Category II Quality*  
4 *Assurance Project Plans* (EPA/600/8-91/004):

5 
$$\%R = \left( \frac{s - u}{C_{sa}} \right) 100$$

6 Where

7 %R = percentage recovery

8 s = measured concentration in spiked laboratory aliquot

9 u = measured concentration in un-spiked laboratory aliquot

10  $C_{sa}$  = actual concentration of spike added

11 Accuracy can also be estimated by calculating percentage recovery for the use of standard reference  
12 materials or surrogates using the following equation, as outlined in *Preparation Aids for the Development*  
13 *of Category II Quality Assurance Project Plans* (EPA/600/8-91/004):

14 
$$\%R = \left( \frac{C_m}{C_{srm}} \right) 100$$

15 Where

16  $C_m$  = measured concentration of standard reference material or surrogate

17  $C_{srm}$  = actual concentration of standard reference material or surrogate

18 Table 3B-1 lists the parameters for which accuracy will be estimated.

19 **3B.5.2.2 Analytical Precision**

20 Precision can be estimated by analyzing matrix spikes and matrix spike duplicates (MSD). The relative  
21 percentage difference (RPD) between the analytical results for the matrix spike samples and the MSD  
22 samples will be calculated as outlined in *Preparation Aids for the Development of Category II Quality*  
23 *Assurance Project Plans* (EPA/600/8-91/004):

24 
$$RPD = \frac{|S_{ms} - S_{msd}|}{\left( \frac{S_{ms} + S_{msd}}{2} \right)} \times 100$$

25 Where

26 RPD = relative percentage difference

27  $S_{ms}$  = matrix spike sample

28  $S_{msd}$  = matrix spike duplicate sample

29 Precision can also be estimated by analyzing duplicate samples. The RPD between the analyte levels  
30 measured in these samples will be calculated using the following equation, provided in *Preparation Aids*  
31 *for the Development of Category II Quality Assurance Project Plans* (EPA/600/8-91/004):

32 
$$RPD = \frac{(C_1 - C_2)}{\left( \frac{C_1 + C_2}{2} \right)} \times 100$$

1 Where

2 RPD = relative percentage difference

3  $C_1$  = larger of the two observed values

4  $C_2$  = smaller of the two observed values

5 Table 3B-1 lists the parameters for which precision will be estimated.

### 6 **3B.5.2.3 Representativeness**

7 Representativeness is a qualitative QA objective that determines the degree to which a sample or group of  
8 samples is indicative of the subject being studied. It takes into account the size and volume of the sample,  
9 as well as the times and locations of sampling. The number of samples collected for the characterization  
10 of waste feed and secondary waste streams will be evaluated during the development of standard  
11 operating procedures to ensure that sampling is representative of the total waste being sampled. Sample  
12 requirements will be periodically re-evaluated as characterization data from previous treatment campaigns  
13 and additional process knowledge becomes available.

14 Liquid samples taken within the WTP will be obtained from agitated vessels or piping systems to ensure  
15 that the sample taken represents the vessel contents.

### 16 **3B.5.3 Method Detection Limits and Estimated Quantitation Limits**

17 The MDLs and the Estimated Quantitation Limits (EQL) supporting waste characterization analysis have  
18 been established in the RDQO Optimization Report (24590-WTP-RPT-MGT-04-001) and limits are  
19 reported based on the appropriate Waste Analysis Plan (WAP). For other analyses supporting  
20 environmental decision-making, the laboratory will establish the MDLs and EQLs in conformance with  
21 SW-846 or other guidance such as 40 Code of Federal Regulations (CFR) Appendix B to Part 136.

22 The MDL is defined as the minimum concentration of a substance that can be measured and reported with  
23 99 percent confidence that the analyte concentration is greater than zero and is determined from analysis  
24 of a sample in a given matrix type containing the analyte.

25 The EQLs are defined as the lowest concentration that can reliably be achieved within specified limits of  
26 precision and accuracy during routine laboratory operating conditions. The EQL is generally 5 to 10 times  
27 the MDL. For many analytes, the EQL analyte concentration is selected as the lowest non-zero standard  
28 in the calibration curve. Sample EQLs are highly matrix-dependent.

29 The MDLs will include sample preparation methods, and will be determined by spiking uncontaminated  
30 water and solid (typically sand) with known concentrations.

31 The EQL is affected by the following:

- 32 • Sample matrix.
- 33 • Sample volume or mass used.
- 34 • Final concentrate volume or final digestate volume from sample preparation.
- 35 • Amount introduced into the instrument for quantitation.
- 36 • Use of dry or wet weight for reporting solids.

37 The SW-846 methods stress that the EQL will differ by matrix and should be evaluated by matrix.

1 Certain samples may be reduced in sample size or diluted for waste minimization and to comply with the  
2 As Low As Reasonably Achievable philosophy, referred to as “ALARA.” The SW-846 “method hotline”  
3 indicates that sample size is not a method modification unless detection limits are not sufficient for  
4 making decisions. Additional guidelines and acceptable minor modifications for radioactive samples have  
5 been established and agreed to as documented in the RDQO Optimization Report (24590-WTP-RPT-  
6 MGT-04-001), Section 9.8.4.

7 Section 3B.6.3, and Table 3B-2 present the Project-specific analytical performance requirements.

#### 8 **3B.5.4 Reporting Requirements**

9 Data generated from laboratory analyses will be reported to Bechtel National, Inc. (BNI) or the Tank  
10 Operations Contractor in an organized format that contains the supporting information required in the data  
11 report package for the appropriate level of data evaluation and assessment. Refer to Section 3B.7.2 for a  
12 discussion of the data report package and to Section 3B.7 for a discussion of data evaluation and  
13 assessment.

14 The reported data will identify the concentration units (e.g., milligrams per liter) and appropriate  
15 laboratory qualifiers. Data reported as non-detected will be referenced against a stated MDL or instrument  
16 detection limit value. Values between the MDL and the EQL will be qualified and documented. If  
17 selected reporting limits are used instead of EQLs or detection limits, the reporting limits will be  
18 consistent with the specific data reporting requirements presented throughout the WAP. Target Minimum  
19 Reportable Quantity (MRQ) ranges have been established in the RDQO Optimization Report. The MDL  
20 will be compared to the minimum reportable quantity to ensure data (non-detection results in particular)  
21 are meaningful for regulatory purposes.

#### 22 **3B.6 DATA ACQUISITION AND MEASUREMENT**

23 The following section addresses the QA requirements for data acquisition and measurement.

##### 24 **3B.6.1 Sampling Procedures and Management**

25 Subsections 3B.6.1.1 through 3B.6.1.4 provide direction on the types of sampling procedures to be  
26 implemented and the types of equipment that may be used to support the sampling, as well as guidance on  
27 how to manage and document field activities.

28 Secondary waste characterization samples are samples of waste and byproducts generated by WTP  
29 processes or support activities (e.g., liquid waste, glass) that require characterization for regulatory  
30 compliance. These samples are subject to the same quality assurance and quality control provisions  
31 outlined in this QAPjP.

##### 32 **3B.6.1.1 Sampling Procedures and Design**

33 The sampling procedures to be implemented for analyzing waste feed from the DST System unit to  
34 support characterization of the waste feed and the characterization of secondary waste streams are  
35 described in the following sections. For each feed staged for transfer to the WTP, a description of the  
36 regulatory compliance sampling activities and analytical requirements will be provided in Tank Sampling  
37 and Analysis Plans (TSAP). For secondary waste characterization, sampling activities and method-  
38 specific requirements (including preservation and holding times) will be established in applicable  
39 procedures and/or secondary waste sampling instructions issued by WTP. For samples taken at WTP,  
40 procedures for sample collection will be developed after the system design is complete and before waste  
41 is received for processing.

1 **3B.6.1.2 Selected Sampling Equipment**

2 Equipment selected to support waste sampling activities will meet the requirements of the specific  
3 SW-846 method or other applicable performance based analytical methods. If modifications of the  
4 procedure are needed, they will be requested in accordance with Washington Administrative Code  
5 (WAC) 173-303-110, Dangerous Waste Regulations – *Sampling, testing methods, and analyses*.

6 When feasible, disposable equipment will be used to collect samples to obviate the need to decontaminate  
7 equipment after use. The process for decontamination of sampling equipment, when necessary, is  
8 presented in Section 3B.6.1.3.3.

9 **3B.6.1.3 Sample Handling and Shipping**

10 Personnel involved in sampling will be trained and qualified on the operating procedures for sampling  
11 before implementing sampling activities.

12 Storage conditions will be evaluated to ensure that the samples remain representative. Waste feed  
13 characterization samples will be collected, packaged, and shipped by the Tank Operations Contractor to a  
14 WTP contracted laboratory. Collection methods, packaging, and shipping instructions will be addressed  
15 in the TSAP and will be governed by Tank Operations Contractor procedures consistent with SW-846,  
16 where applicable, with allowances for sample size reduction to maintain personnel dose rates ALARA.  
17 The specific description of sample collection activities will be included in the TSAPs for each WTP feed  
18 compliance sampling event.

19 Waste feed characterization samples will not be chemically or thermally preserved during transfer or  
20 shipment to the WTP contracted laboratory (these preservation techniques react with the tank waste).  
21 Care will be taken during sampling to avoid the temporary storage of samples in excessively high or low  
22 temperatures. The samples shall be shipped on the same day as sampled whenever possible to meet  
23 analytical holding time requirements.

24 Secondary waste characterization samples shall be preserved, contained, and temperature-controlled in  
25 accordance with the applicable analytical method requirements (e.g., SW-846, Standard Methods, or other  
26 approved performance-based methods), including chemical and/or thermal preservation, container type,  
27 and holding times. Where method-specified immediate preservation is required, preservatives shall be  
28 added at the time of collection or as soon as practicable in a radiologically controlled area when worker  
29 protection or ALARA considerations necessitate delayed addition. In all cases, preservation shall occur  
30 within the time frame specified by the method. Secondary waste samples shall be packaged and shipped  
31 in a manner that maintains the required preservation conditions for the duration of transport to the  
32 Laboratory of Record (LOR).

33 A unique identification number generated by the Laboratory Information Management System (LIMS)  
34 will be marked on each sample container before collecting the sample. This number will be recorded on  
35 the chain-of-custody form. The sample labeling and chain-of-custody documentation will be checked to  
36 ensure the traceability of each of the samples.

37 **3B.6.1.3.1 Chain-of-Custody**

38 The ability to demonstrate that samples were obtained from the locations specified in the applicable WAP  
39 and that they reached the laboratory without alteration are key considerations for data resulting from  
40 laboratory analysis. Evidence of collection, shipment, receipt at the laboratory, and laboratory custody  
41 until disposal will be documented using a chain-of-custody form. The chain-of-custody form will, as a  
42 minimum, supply the following information:

- 43 • Sample identification number.
- 44 • Sample volume.
- 45 • Number of sample bottles/type.

- 1 • Method of sampling.
- 2 • Sampling date and time.
- 3 • Sampling location.
- 4 • Name of the contact person.
- 5 • Shipping date.
- 6 • Analyses to be performed.
- 7 • Preservation method.
- 8 • Sample characteristics (if any).

9 A sample will be considered to be in custody when it is under any of the following conditions:

- 10 • In a person's possession.
- 11 • In view, after having been in a person's physical possession.
- 12 • Locked so that it cannot be tampered with, after having been in a person's physical custody.
- 13 • Sealed with tamper-proof seal.
- 14 • In a secured area, restricted to authorized personnel only.

15 Chain-of-custody forms will be included in the final data report package. Electronic chain-of-custody  
16 forms and electronic signatures may be used.

17 The chain-of-custody practices and procedures for the WTP will address the following general  
18 requirements for custody records:

- 19 • Sample management planning and procedures will identify responsibilities, including interfaces  
20 between organizations for documenting possession of a sample from collection and identification  
21 through handling, preservation, shipment, transfer, analysis, storage, and final disposition.
- 22 • Sample traceability will ensure that it can be tracked from its collection through final disposition.
- 23 • Sample identification will be documented and checked before the sample is released.
- 24 • If individual samples have specific custody requirements, as required by documents such as the  
25 WAP, TSAP, test plans, study plans or job packages, these requirements will be implemented.
- 26 • For samples with limited use or storage life, methods will be established that preclude using an  
27 out-of-date sample.

28 Implementing documents will identify those representative samples that need to be archived.

### 29 **3B.6.1.3.2 Sample Preservation, Containers, and Holding Time**

30 Table 3B-3 lists the sample container, preservation method, and holding time requirements for different  
31 types of analyses.

### 32 **3B.6.1.3.3 Maintaining and Decontaminating Field Equipment**

33 Field equipment used to support waste monitoring and sampling activities will be maintained in  
34 accordance with manufacturer guidelines, and will be decontaminated prior to use. Disposable sampling  
35 equipment will be used whenever possible due to the high concentrations of radionuclides in the waste  
36 materials to be sampled.

37 Equipment decontamination will be performed according to approved procedures and consistent with  
38 guidance provided in the following references or by the manufacturer:

- 39 • SW-846, *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods*.
- 40 • *A Compendium of Superfund Field Operations Methods* (EPA/540/P-87/001).

1 **3B.6.1.4 Sampling Quality Assurance and Quality Control Procedures**

2 The QA audits and surveillances of sampling activities will be conducted by the Manager of Quality  
3 (or designee) to verify the implementation of QAPjP requirements. Management assessments will also be  
4 performed by the Lab Technical Point of Contact (or designee) to ensure that the waste sampling program  
5 is adequate and effective. Revisions to established sampling procedures will be reviewed to determine  
6 their possible impacts on data quality and approved by authorized personnel prior to issuance and  
7 implementation. Field records and documentation, including field measurements, will be handled and  
8 preserved in a manner consistent with Section 3B.4.2 of this QAPjP. The QA surveillances and audits,  
9 management assessments, corrective actions, and root cause analyses will be implemented as described in  
10 Section 3B.7 of this QAPjP.

11 **3B.6.2 Instrument and Equipment Calibration, Testing, Inspection, and Maintenance**

12 The following sections address instrument calibration, testing, inspection, and maintenance requirements  
13 for waste analysis.

14 **3B.6.2.1 Instrument Calibration Frequency**

15 Analytical laboratory personnel will be responsible to ensure that instruments are calibrated in accordance  
16 with approved procedures. Instrument calibration will comply with applicable QA/QC requirements of  
17 the applicable analytical method. Instrument calibration records will be managed in accordance with  
18 Section 3B.4.2 of this QAPjP.

19 **3B.6.2.2 Instrument and Equipment Testing, Inspection, and Preventive Maintenance**  
20 **Requirements**

21 The analytical laboratory management (or designee) will ensure that laboratory instruments are routinely  
22 tested and inspected to confirm that they are in proper working order. Preventive maintenance schedules  
23 recommended by the equipment manufacturer will be implemented and documented. Instrument  
24 maintenance records will be managed in accordance with Section 3B.4.2 of this QAPjP.

25 **3B.6.3 Sample Preparation Methods, Analytical Methods, and Analytical Performance**  
26 **Requirements**

27 The sample preparation methods, analytical methods, and performance requirements (e.g., limits,  
28 precision, and accuracy) for analyses are summarized in Table 3B-3 and Table 3B-2, and are consistent  
29 with the requirements specified in SW-846 and in conformance with the appropriate WAP. Any  
30 applicable analytical method provided in WAC 173-303-110 may be used for analysis. If an analytical  
31 method used for regulatory purposes other than the methods provided in WAC 173-303-110 are proposed,  
32 approval of the method will be requested from Department of Ecology (Ecology) according to  
33 WAC 173-303-910(2). The proposed analytical method will not be used for regulatory purposes until  
34 Ecology authorizes the method. If modifications to a procedure are needed, they will be requested in  
35 accordance with WAC 173-303-110(4). The SW-846 “method hotline” indicates that sample size is not a  
36 method modification unless detection limits are not sufficient for making decisions.

37 **3B.6.4 Analytical Laboratory Information Management**

38 The LIMS is part of the Plant Information Network (PIN) system. Sample and QC data generated by the  
39 analytical laboratory will be stored in the LIMS database. At a minimum, this database will hold the  
40 sample number, sample collection date, analysis date, analytical methods employed, analytical results,  
41 and qualifiers. In the event of a LIMS system failure, this information will be recorded in paper form and  
42 entered into LIMS when the system is operating.

1 **3B.6.5 Analytical Laboratory Quality Control**

2 The analytical laboratory QC procedures will involve the analysis of duplicates, method blanks,  
3 laboratory control samples and matrix spike samples. Lab QA parameters will be described in the  
4 commercial laboratory QAM/QAPjP and placed in the operating record. State accredited laboratories will  
5 be used where possible and where not possible, BNI will provide all necessary information for the State  
6 of Washington to determine the validity of the analytical data. Testing laboratories that are not state  
7 accredited still must meet the QA/QC requirements of the WAP and documentation of the specification  
8 and conformation/audit process will be available upon request and maintained in the operating record.

9 **3B.7 PERFORMANCE ASSESSMENTS, CORRECTIVE ACTIONS, AND EVALUATIONS**

10 The following subsections address assessment and oversight requirements.

11 **3B.7.1 Routine Analytical Laboratory Assessment and Corrective Actions**

12 The Lab Technical Point of Contact (or designee) will conduct periodic assessments to verify that  
13 laboratory procedures meet the requirements of this QAPjP. The QA surveillances and audits will be  
14 conducted by the Manager of Quality (or designee) to ensure that laboratory activities comply with  
15 applicable QA requirements. Management assessments will also be performed by the Lab Technical Point  
16 of Contact (or designee) to ensure that the laboratory program is adequate and effective.

17 Management assessments, QA surveillances and audits, corrective action, and root cause analyses will be  
18 conducted according to approved procedures.

19 **3B.7.2 Data Reduction and Review**

20 Data reduction and review procedures will be developed for data generated for environmental compliance  
21 according to the requirements of the current version of SW-846 or other applicable guidance such as  
22 *Guidance for Quality Assurance Project Plans* (EPA QA/G-5, EPA/240/R-02/009), prior to the operation  
23 of the analytical laboratory.

24 **3B.7.3 Reports to Management**

25 Conditions identified as having an adverse effect on quality, the significance of such conditions, and  
26 corrective actions will be documented, reported to the appropriate level of management, and resolved  
27 according to approved procedures.

28 The assessment reports may include the following items, as appropriate:

- 29
- 30 • Deviations from the requirements specified in this QAPjP.
  - 31 • Limitations or constraints on the applicability of the resulting analytical data.
  - 32 • Results of QA surveillances and audits of the waste analysis program.
  - 33 • Management assessments of data quality in terms of MDLs, precision, accuracy, and  
34 representativeness. The quantitative performance indicators for precision and accuracy are given  
in Table 3B-1.

35 **3B.8 VERIFICATION AND ASSESSMENT OF ANALYTICAL DATA**

36 A graded approach to data verification and assessment processes will ensure that the data resulting from  
37 the selected analytical method are consistent with the requirements specified in this QAPjP. Data  
38 validation will be performed when necessary.

39 **3B.8.1 Data Verification**

40 The primary data reporting will be via electronic data systems. Data verification will be performed on  
41 laboratory data packages that support environmental compliance to ensure that their content is complete  
42 and in order. A review of the data package will be performed to ensure the following:

- 1 • The data package contains the required technical information.
- 2 • Deficiencies are identified and documented.
- 3 • Identified deficiencies are corrected by the laboratory and the appropriate revisions are made.
- 4 • Deficient pages are replaced with the laboratory corrections.
- 5 • Data package revisions are tracked.
- 6 • A copy of the completed verification report is placed in the data file.

### 7 **3B.8.2 Data Evaluation and Assessment**

8 The data reports received from the laboratory will serve as documentation of an analytical project. The  
9 primary data reporting will be by electronic systems. The following are examples of the information  
10 contained in data reports documenting environmental support activities:

- 11 • Sample identifications.
- 12 • Holding times, including the following:
  - 13 • Sampling date.
  - 14 • Date the laboratory received the sample.
  - 15 • Extraction or preparation date.
  - 16 • Analysis date.
  - 17 • Re-extraction or re-analysis dates.
- 18 • Analytical parameters.
- 19 • QC, including the following:
  - 20 • Laboratory control sample (LCS)/standard including percent recovery.
  - 21 • Preparation blanks, including identity and concentration of each constituent identified.
  - 22 • Sample, duplicate (including RPD) and replicate results.
  - 23 • Recovery results of matrix spikes, MSDs, or post digestion spikes (if matrix spike not
  - 24 performed).
  - 25 • Detection limits.
  - 26 • Report uncertainty/counting error for radiochemical analysis.
  - 27 • Additional data reporting (that is, the percent of moisture/solid or correction for equivalent
  - 28 dry weight).
- 29 • QA, including the following:
  - 30 • Descriptions of procedures and methods used to generate the results.
  - 31 • Deviations from procedures.
  - 32 • Analytical anomalies for raw data results, spikes, surrogates, and method blanks.
  - 33 • Analytical qualifiers.
  - 34 • Calibration and instrument tuning.
  - 35 • Corrective actions implemented.
  - 36 • Raw analytical data.
  - 37 • Chain-of-custody.

38

**Table 3B-1 Quality Control Parameters for SW-846 Test Methods**

Analytes	Method	QC Acceptance Criteria			
		LCS % Recovery	Spike % Recovery	MSD/ Duplicate RPD	Replicate % Relative Standard Deviation
Metals, except Mercury	6010D or 6020B	80-120%	75-125%	≤ 20%	≤ 20%
Mercury	7470A or 7471B	80-120%	75-125%	≤ 20%	≤ 20%
pH	9040C	±0.1 pH unit	N/A	N/A	N/A
Volatile organic compounds <sup>1</sup>	8260B	70-130%	50-150%	≤ 30%	≤ 30%
Semivolatile organic compounds <sup>1</sup>	8270E	70-130%	50-150%	≤ 30%	≤ 30%
Organochlorine pesticides <sup>1</sup>	8081B	70-130%	50-150%	≤ 30%	≤ 30%
PCBs	8082A	70-130%	50-150%	≤ 30%	≤ 30%
Inorganic anions	9056A	80-120%	75-125%	< 20%	< 20%
Cyanide <sup>1</sup>	Method 9010C/9014 or 9012B	80-120%	75-125%	< 20%	< 20%
Ammonia	SM 4500-NH <sub>3</sub> F or Method 350.1 or Method 350.3	80-120%	75-125%	< 20%	< 20%

<sup>1</sup>These constituents are specific to the Baseline configuration.

1

**Table 3B-2 Analytical Method Requirements for Tank Waste Acceptance Samples**

Constituent	Limit	Analytical Method <sup>1</sup>	
		Solid	Liquid
TOC	TOC < 10% percent weight (wt)	Method 9060A	Method 9060A
PCBs	PCBs < 50 parts per million (ppm)	8082A	8082A
pH	pH > 12	9040C	9040C
Compatibility	Acceptable temperature change < ± 20°C No viscosity change adversely affecting waste processing	N/A	ASTM D5058-12
Metals, except mercury	per Permit Condition Table III.10.H.D	6010D or 6020B	6010D or 6020D
Mercury	Hg < 1.4E-05 mol/mol sodium	7471B	7470A
Volatile organic compounds <sup>2</sup>	Not applicable	8260B	8260B
Semivolatile organic compounds <sup>2</sup>	Not applicable	8270E	8270E

**Table 3B-2 Analytical Method Requirements for Tank Waste Acceptance Samples**

Constituent	Limit	Analytical Method <sup>1</sup>	
		Solid	Liquid
Organochlorine pesticides <sup>2</sup>	Not applicable	8081B	8081B
Inorganic anions – Ratio to Sodium (Cl, F, SO <sub>4</sub> ) <sup>3</sup>	Cl < 3.7E-2 mol/mol sodium F < 9.1E-2 mol/mol sodium SO <sub>4</sub> < 7.0E-2 mol/mol sodium	Method 300.0/9056A or ASTM D3987-85/9056A	9056A
Cyanide <sup>2</sup>	Not applicable	9010C/9014 or 9012B	9010C/9014 or 9012B
Ammonia	Ammonia/Ammonium < 0.04 M	Not Applicable	SM 4500-NH <sub>3</sub> -F or, Method 350.1 or Method 350.3

<sup>1</sup>The latest update version of the method will be used for testing, unless specified otherwise.

<sup>2</sup>These constituents are specific to the Baseline configuration.

<sup>3</sup>Nitrate, Nitrite, Bromide, and Phosphate Acceptance Criteria limits will be added when the WAP is updated for Baseline operations.

<sup>a</sup>Collection of samples is in accordance with ALARA requirements for contamination control and to minimize sampler exposure. The RDQO Optimization Report (24590-WTP-RPT-MGT-04-001) specified a minimum 350 g of sludge solids (if present in the tank) and 500 mL of liquid to complete the regulatory compliance testing for each WTP feed tank, however, it is anticipated that 300 mL slurry containing at least 30 g of solids per HLW sample, and 170 mL of supernatant liquid per sample shall be sufficient. Per the sampling event requirements described in the RDQO Optimization Report, the specific sample volume and number of samples to be collected are to be specified in the TSAP for the corresponding staged feed. The sample material is collected in the field, and then sub-aliquoted (and centrifuged, if necessary) in the laboratory under controlled conditions to further reduce exposures. Per the Performance Based Measurement System approach and safe handling procedures required to limit radiological dose, sample sizes may be reduced from those recommended in the analytical methods identified in Table 3B-1 and Table 3B-2.

<sup>b</sup>Methodologies may be modified per requirements of the RDQO Optimization Report.
