Critter of the month: The Moss Animals
Personal stories
Generating high quality data takes work and attention to detail.

Climate & streams
River flows have been low this winter because fall and winter were relatively warm and dry. February snow could not reduce the deficit. Luckily, warmer conditions at the end of March normalized streamflow in snow-dominated watersheds, but not so for rain-dominated watersheds.

Water temperature and food web
It is getting too cold for anchovies in South Sound and the Juan de Fuca Strait. Hood Canal is a thermal refuge for cold-sensitive species.

Aerial photography
The productive season is in full swing in the finger inlets of South Sound, Kitsap Peninsula, and Quartermaster Harbor. Jellyfish aggregations are present in Budd, Eld, Totten, and Sinclair Inlets. Following a strong bloom in Hood Canal last month, *Noctiluca* is present in southern Hood Canal and Totten Inlet.
We check all our instruments before we take them in the field against a “pristine” sensor that stays in the laboratory. Conductivity, temperature, and dissolved oxygen are all checked against the lab sensor and each other. The set up, data collection, and clean up take all day!

We put all three of our instrument packages into a salt water bath once a month.

Stay tuned for results…
What was the water visibility like for divers?

Best and worst horizontal visibility at corresponding vertical depth

Visibility can be very different at different depths at the same site.

Find depths with high/low visibility

- **Best visibility** occurred in Hood Canal near Octopus Hole (location 6) with 43 ft visibility (at 75 ft depth), despite having poor visibility near the surface.

- **Poor visibility** (no diver icon) occurred in Admiralty Reach near the surface (location 2).

- The poster, “Underwater Visibility Maps – a Tool for Scuba Divers,” is available [here](#).

This is a new feature and we are soliciting feedback ([skip.albertson@ecy.wa.gov](mailto:skip.albertson@ecy.wa.gov)).
Critter of the Month – The Moss Animals

**Stuck on You**

Have you ever seen what looks like a clump of weeds or a lichen-like crust stuck to a rock or some kelp in Puget Sound? If so, chances are you’ve spotted a moss animal, or bryozoan! Bryozoans are amazing colonial animals in plant disguises. Find out more about them in this month’s blog!

**Fun Bryozoan Facts**

- Their colonies are made up of tiny individual animals called zooids.
- They can defend themselves with tiny bird beaks.
- Their calcium carbonate skeletons make them a focus of new ocean acidification research.

Learn more about moss animals and other critters on Ecology’s EcoConnect blog [here](#).
In March, Puget Sound air temperatures were below normal and precipitation remained below normal (A). At the seasonal peak of snowpack accumulation, watersheds that drain to Puget Sound hold below-normal volumes (B). Monitoring snowmelt rates and timing will be critical as we transition to summer with the potential for reduced flows to Puget Sound.

**A. Northwest Climate Toolbox**

**Temperature Anomaly**
from historical mean daily ranged from 0 to -4 °F in the Puget Sound region during the past 30 days.

**Precipitation Anomaly**
from historical mean ranged from -1 to -5 inches in the Puget Sound region during the past 30 days.

**B. Washington SNOTEL, USDA/NRCS**

April 1st, 2019

**Snow water equivalent** percent of median for watersheds draining to Puget Sound are below normal. At the typical peak of seasonal snowpack accumulation, April 1, Puget Sound is at 74% of its historical median.
A warming trend at the end of March brought streamflow in snow-dominated watersheds up to normal levels following much below-normal conditions (see trend charts). Most stream gages are reporting normal flows except for those that are in rain-dominated watersheds (see map). Air temperature will play a critical role in determining how long our reduced snowpack can sustain streamflows to Puget Sound in the summer months.
Historically, the peaks of coastal upwelling and the freshet are in sync. In 2018, a strong freshet preceded low flows.

The Fraser River is the major driver of estuarine circulation and water exchange between the Salish Sea and the ocean. Fraser River flows are currently very much at expected levels.

How do ocean boundary conditions affect the quality of water we exchange with the ocean? Past years’ warm water is gone (PDO) and upwelling is expected (Upwelling Index anomaly). NPGO, which reflects the surface productivity along the coast, is expected as well.

Pacific Decadal Oscillation Index (PDO, temperature, explanation). Upwelling Index (anomalies) (Upwelling, low oxygen, explanation). North Pacific Gyre Oscillation Index (NPGO, productivity, explanation).
What influences Puget Sound’s water quality?

In the anomaly plot, we want to connect different factors influencing water quality in the context of space and time. Conditions leading up to March 2019 were drier with lower river flows than in the 2017 – 2018 winter. The past winter has been warmer than the previous two years, but February was much colder in 2019. In 2018, fall and early winter were generally sunnier than the year before. For recent river and stream inflow, see page 6.

Conditions leading up to March:

**Air temperatures** have generally been warmer this winter except for February.

**Precipitation** for the past five months has been lower than in 2017.

**Sunshine** (opposite of cloud cover) occurred more often than the previous winter, although February was cloudier.

**River flows** were low through the winter. When precipitation was higher, it was cold and became snowpack.

**Upwelling** and ENSO (MEI) were more moderate in 2018 than 2017.

All data are from public sources: UW GRAYSKIES; river flows from USGS and Environment Canada; indices from NOAA & UW (PDO).
Water temperature affects ecosystem performance

**Can organisms thrive and survive?**

The life cycles of organisms respond to temperature. To be successful, the timing of early life stages must line up with good growth conditions.

Temperature is important for growth, but also dictates if certain organisms can overwinter in Puget Sound (e.g., northern anchovy).

*Help us get these right. We scoured the literature for temperatures important to the success and survival of marine organisms.*

**In February**, following a cold spell, average water temperatures in surface water (0 – 30 m deep) were cooler than the baseline (1999 – 2016) with the exception of Whidbey Basin and the Strait of Juan de Fuca. Hood Canal remained the warmest, but was lower than normal. **San Juan Island and South Sound are now at below-tolerable temperatures for anchovies** (see red boxes below).
What are the conditions at the surface?

The productive season is in full swing in the finger inlets of South Sound, Kitsap Peninsula, and Quartermaster Harbor. Jellyfish are present in Budd, Eld, Totten, and Sinclair Inlets. Suspended sediment detaching from shore along tidal fronts makes the distinction between sediment and spawning fish prone to error. Signs of *Noctiluca* spotted in Totten Inlet, Belfair, and Hood Canal.

**Mixing and fronts:**
Tidal fronts carry sediment mid-channel at prominent points on the shoreline.

**Jellyfish and fish:**
Jellyfish patches in Budd, Eld, Totten, and Sinclair Inlets.

**Suspended sediment:**
Suspended sediment from rivers is low. Wave and wind re-suspend sediment near the shoreline and transport it long distances.

**Visible blooms:**
Brown-green blooms in Budd and Totten Inlets, Agate Passage, Liberty Bay, and Quartermaster Harbor. Red-brown bloom in Sinclair and Dyes Inlets and Quartermaster Harbor. Signs of *Noctiluca* (bright orange) in parts of Totten Inlet and Southern Hood Canal.

**Debris:**
Orange-colored organic material drifting in Totten Inlet near Steamboat Island.

Flight Observations
Sunny and windy toward the north

Map Key
- Flight route
A. & B. Effluent from Cosmo Specialty Fiber rises to the surface. C. This also happened in September 2018.

Location: Aberdeen (Grays Harbor), 12:35 PM
Jellyfish aggregation.
Location: Totten Inlet (South Sound), 11:49 AM
A. Reddish organic material accumulating at surface. Could this be *Noctiluca*?  
B. *Noctiluca* near Belfair.  

Location:  
A. Carlyon Beach, (South Sound), 11:52 AM;  
B. Belfair (Hood Canal) 4-1-2019.
Orca Network Whale Sighting Report from April 2, 2019

“An abundance of the mammal eating type orcas are showing up in numbers throughout the Salish Sea. Puget Sound saw a large number of T’s on the 26th. This large group came down Admiralty Inlet the afternoon prior (25th) and sometime that afternoon or overnight joined up with the two families (T46s and T137s) who had been here for several days.”
Large plume of suspended sediment.
Location: Case Inlet (South Sound), 11:59 AM
Large aggregation of harbor seals surrounding the shallows of a haul-out site.
Location: Cutts Island, Carr Inlet (South Sound), 12:05 PM
Jellyfish aggregation and early signs of a red-brown bloom.
Location: Sinclair Inlet (Central Sound), 12:15 PM
A. Dosewallips River delta with macroalgae. B. Turbid patch with many seabirds.
Location: Dosewallips River, Dabob Bay (Hood Canal), 12:25 PM
Suspended sediment dispersing mid-channel along front.
Location: Quilcene Bay (Hood Canal), 12:28 PM
Suspended sediment makes spotting herring impossible.

Location: Discovery Bay (Hood Canal), 12:33 PM
Question:
How can you tell what might be schooling fish or seagrass?

Answer:
Google images help us figure it out.

Fish move around, whereas seagrass doesn’t.

A. Dark patches not seen on Google images. B. Patches are likely fish in Dabob Bay Natural Area Preserve.

Location: Dabob Bay (Hood Canal), 12:36 PM
A lot of suspended sediment, but no creek? What could have caused this?
Location: North of Kingston (Central Basin), 12:48 PM
A big patch in shape of a double eddy containing suspended sediment likely from a prop wash.

Location: Salmon Bay (Seattle), 1:15 PM
Suspended sediment from bluff erosion fanning out far offshore along a front.

Location: West Point (Central Sound), 1:18 PM
Blooms of different colors meet near Agate Pass. Is the whitish water spawning herring?

Location: Agate Passage (Central Sound), 1:26 PM
Thick blooms at the entrance to Liberty Bay. Suspended sediment from Bjorgen Creek.

Location: Lemelo (Central Sound), 1:27 PM
Bloom in northern portions of Dyes Inlet.
Location: Dyes Inlet (Central Sound), 1:33 PM
A. Brown algal bloom in the inner bay. B. Brown-reddish bloom near Dockton.
Location: Quartermaster Harbor (Central Sound), 1:46 PM
A. We documented a tidal eddy on Feb 27, 2012. B. Is this partially the cause for the scoured ocean floor?

Location: McNeil Island, (South Sound), 2:03 PM
Suspended sediment off South Head, or is it possibly spawning herring?

Location: Pitt Passage, Carr Inlet (South Sound), 1:58 PM
