**TRUST WATER RIGHT
 REPORT OF EXAMINATION**

File NR: CS4-07213J(B)
 WR DOC ID: 4846740

Add Purpose of Use	Change Place of Use	
PRIORITY DATE 1888	TRUST TERM Permanent	WATER RIGHT NUMBER Beaver Creek Adjudicated Certificate 213, Certificate of Change, Volume 3, page 1121

APPLICANT:
 Robert and Mary Campbell
 126 Upper Beaver Creek Rd
 Twisp, WA 98856-9759

FILE NUMBER
 CS4-07213J(B)

Cecilia Campbell
 109 Upper Beaver Creek Rd
 Twisp, WA 98856-9759

REMARKS: This change reflects Ecology's purchase of late season water rights from Robert and Mary Campbell and Cecilia Campbell. In conjunction with other changes to Certificates 213, 214, 216, and 217, there will be no diversion of these rights from August 1st through May 1st of the following irrigation season.

Purpose and Quantity

Instream flows in the following quantities are attributed to the Primary and Secondary Reaches of Beaver Creek

	Primary Reach		Secondary Reach	
	Qa (ac-ft/yr)	Qi (cfs)	Qa (ac-ft/yr)	Qi (cfs)
August 1-31	31.37	0.511	13.49	0.220
September 1-15	15.17	0.511	6.52	0.220
Total	46.54		20.01	

Place of Use (See Map in Attachment 1)

Primary Reach – Approximately 2.4 miles of Beaver Creek beginning at the point of diversion for the Batie Ditch, within the SW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M. at river-mile 6.4, extending downstream to river-mile 4.

Secondary Reach – Approximately 4 miles of Beaver Creek Beginning at the end of the primary reach at river-mile 4, and extending downstream to the confluence of Beaver Creek and the Methow River.

**PORTION OF WATER RIGHT
NOT BEING TRANSFERRED TO INSTREAM FLOWS
WRTS File #: CS4-07213J(A)**

PRIORITY DATE 1888	WATER RIGHT NUMBER Beaver Creek Adjudicated Certificate 213, Certificate of Change, Volume 3, page 1121
REMARKS:	

Purpose and Quantity

Irrigation of 25.57 acres
0.02 cfs per acre for a total of 0.511 cfs, 93.19 ac-ft/yr from May 1 through July 31.

Source Location

COUNTY	WATERBODY	TRIBUTARY TO	WATER RESOURCE INVENTORY AREA
Okanogan	Beaver Creek	Methow River	48

POINT OF DIVERSION

SW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M.

Place of Use

E½NW¼ and the NW¼NE¼ of Sec. 11, and the SW¼SE¼ of Sec. 2, all within T. 33 N., R. 22 E.W.M.

Measurement of Water Use

How often must water use be measured?	Monthly
How often must water use data be reported to Ecology?	Annually, by January 31st of each calendar year.
What volume should be reported?	Total Annual Volume
What rate should be reported?	Monthly Peak Rate of Diversion in cfs.

Provisions Related to the Portion of the Water Right Being Retained

No water shall be diverted under Certificate 213 after July 31 through the remainder of the irrigation season each year.

Water Measurement
An approved measuring device must be installed and maintained for each of the sources identified by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use", WAC 173-173, which describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition the Department of Ecology for modifications to some of the requirements.

Recorded water use data shall be submitted via the Internet. To set up an Internet reporting account, contact the Regional Office. If you do not have Internet access, you can still submit hard copies by contacting the Regional Office for forms to submit your water use data.

Easement Right of Way

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the records of water use that are kept to meet the above provisions, and to inspect at reasonable times any measuring device used to meet the above provisions.

Fish Screening Criteria

The intake(s) shall be screened in accordance with Department of Fish and Wildlife (WDFW) screening criteria (pursuant to RCW 77.57.010, RCW 77.57.070, and RCW 77.57.040). If you have questions about screening criteria contact WDFW at:

Department of Fish and Wildlife
Attention: Habitat Program
600 Capitol Way N
Olympia, WA 98501-1091

Phone: (360) 902-2534
Website: <http://www.wdfw.wa.gov/reg/regions.htm>

No dam or weir shall be constructed in connection with this diversion.

Findings of Facts

Upon reviewing the investigator's report, I find all facts relevant and material to the subject application have been thoroughly investigated. Furthermore, I concur with the investigator that there will be no impairment of existing rights and that there will be no detriment to the public interest.

Therefore, I ORDER approval of Change Application No. CS4-07213J(B), subject to existing rights and the provisions specified above.

YOUR RIGHT TO APPEAL

You have a right to appeal this Order to the Pollution Control Hearings Board (PCHB) within 30 days of the date of receipt of this Order. The appeal process is governed by Chapter 43.21B RCW and Chapter 371-08 WAC. "Date of receipt" is defined in RCW 43.21B.001 (2).

To appeal you must do the following within 30 days of the date of receipt of this Order:

- File your appeal and a copy of this Order with the PCHB (see addresses below). Filing means actual receipt by the PCHB during regular business hours.
- Serve a copy of your appeal and this Order on Ecology in paper form - by mail or in person. (See addresses below.) E-mail is not accepted.

You must also comply with other applicable requirements in chapter 43.21B RCW and chapter 371-08 WAC.

Signed at Yakima, Washington, this _____ day of _____, 2013.

Mark Kemner, LHG, Section Manager
Water Resources Program/CRO

BACKGROUND

Project Overview

On June 17, 2011 Robert and Mary Campbell, and Cecelia Campbell (Campbells) filed several applications with the Washington State Department of Ecology (Ecology) to transfer portions of their water rights to trust. These applications correspond to the sale and lease of water rights by the Campbells to Trout Unlimited (TU), a nonprofit corporation working on behalf of Ecology to increase flows in Beaver Creek during times of critically low flows. To this end, TU purchased and leased the late season water from four water rights: Beaver Creek Adjudicated Certificates 213, 214, 216, and 217. The project seeks to eliminate the diversion of water for these rights from August 1 April 30th (the beginning of the following irrigation season). This report specifically addresses change application No. CS4-07213J(B) which pertains to Beaver Creek Adjudicated Certificate 213. TU permanently acquired (purchased) the late season water associated with 25.57 acres of irrigation. It is the task of this investigator to recommend whether this water may be transferred to instream flows. The following table lists all applications involved in this project:

Applicant	Application No.	Certificate No.	Transaction for Late Season Water
Campbells	CS4-07213J(B)	213	Purchase
Campbells	CS4-07214J(A)(b)	214	20 Year Lease
Campbells	CS4-07214J(B)	214	Purchase
Campbells	CS4-07216J(B)	216	Purchase
Campbells	CS4-07217J(A)(b)	217	20 Year Lease
Campbells	CS4-07217J(B)	217	Purchase

Significant efforts are being made to restore flows in Beaver Creek because it was historically a steelhead stream and could produce up to 10% of the Methow River run if fully functional (Mark Cookson, WDFW), with spawning and rearing as the major biological function. In the 2001 Methow Subbasin Plan, Beaver Creek is listed as a critical tributary and instream flow is identified as a limiting factor. In addition, this project will address several of the strategies identified in the 2004 Methow Subbasin Plan:

- Increase the survival of summer steelhead and bull trout at all juvenile summer and winter rearing life stages.
- Support resident and anadromous fishes similar to an undisturbed watershed of similar size, geology and geography.
- Protect key habitat and channel conditions by restoring and maintaining habitat processes.
- Protect healthy areas and restore degraded riparian zones to a more natural condition.

Increasing flows will lower stream temperatures in summer months, which is especially needed in the lower reaches of the Methow River. Higher flows also dilute toxic materials or other contaminants entrained in the stream.

Shouldn't start over

Table 1: Attributes of Certificate No. 213 and the Proposed Changes

Attributes	Existing	Proposed
Name	B.J. Batie	Trust Portion: Department of Ecology Retained Portion: Robert and Mary Campbell, Cecelia Campbell, and the Methow Salmon Recovery Foundation
Priority Date/ Change Application Date	Priority Date – 1888 (Class 2)	Application Date – June 17, 2011
Instantaneous Quantity	0.51 cfs	Trust Portion: 0.51 cfs in the late season
Purpose of Use	Irrigation of 25.57	Trust Water Portion: Instream Flow Retained Portion: Crop Irrigation, Stock and Domestic Use
Period of Use	May 1 through September 15	Trust Portion: Instream Flow (Aug 1 through Sep 15) Remaining Portion: Crop Irrigation (May 1-July 31)
Place of Use	E½NW¼ and the NW¼NE¼ of Sec. 11, and the SW¼SE¼ of Sec. 2, all within T. 33 N., R. 22 E.W.M.	Trust Water Portion: Instream flow in Beaver Creek Remaining Portion: No change
Point of Diversion	SW¼SE¼ of Section 35, T. 34 N., R. 22 E.W.M.	Trust Water Portion: no diversion Remaining Portion: no change

Legal Requirements for Proposed Change

The following is a list of requirements that must be met prior to authorizing any change to a water right.

- Public Notice**
Notice of the proposed appropriation was published in the Methow Valley News of Twisp, Washington, on November 16th and November 23rd, 2011. The protest period ended on December 24, 2011. One protest letter was received; see the *Protests and Comments* section below.
- State Environmental Policy Act (SEPA)**
This project required a SEPA review under WAC-197-11-800(4). Ecology, acting as the SEPA lead agency, determined that this project will not have a probable significant adverse impact on the environment and issued a Determination of Non-significance (DNS) on January 17, 2012. No comments were received.
- Water Resources Statutes and Case Law**
Transferring a water right to the Trust Water Right Program is governed by RCW 90.42.

Washington Supreme Court has held that Ecology, when processing an application for change to a water right, is required to make a tentative determination of extent and validity of the claim or right. This is necessary to establish whether the claim or right is eligible for change. *R.D. Merrill v. PCHB and Okanogan Wilderness League v. Town of Twisp*.

This application qualifies for expedited processing under WAC 173-152-050(3)(a) whereby water right change applications may be processed prior to applications submitted at an earlier date when the proposed water use, if approved, would substantially enhance or protect the quality of the natural environment.

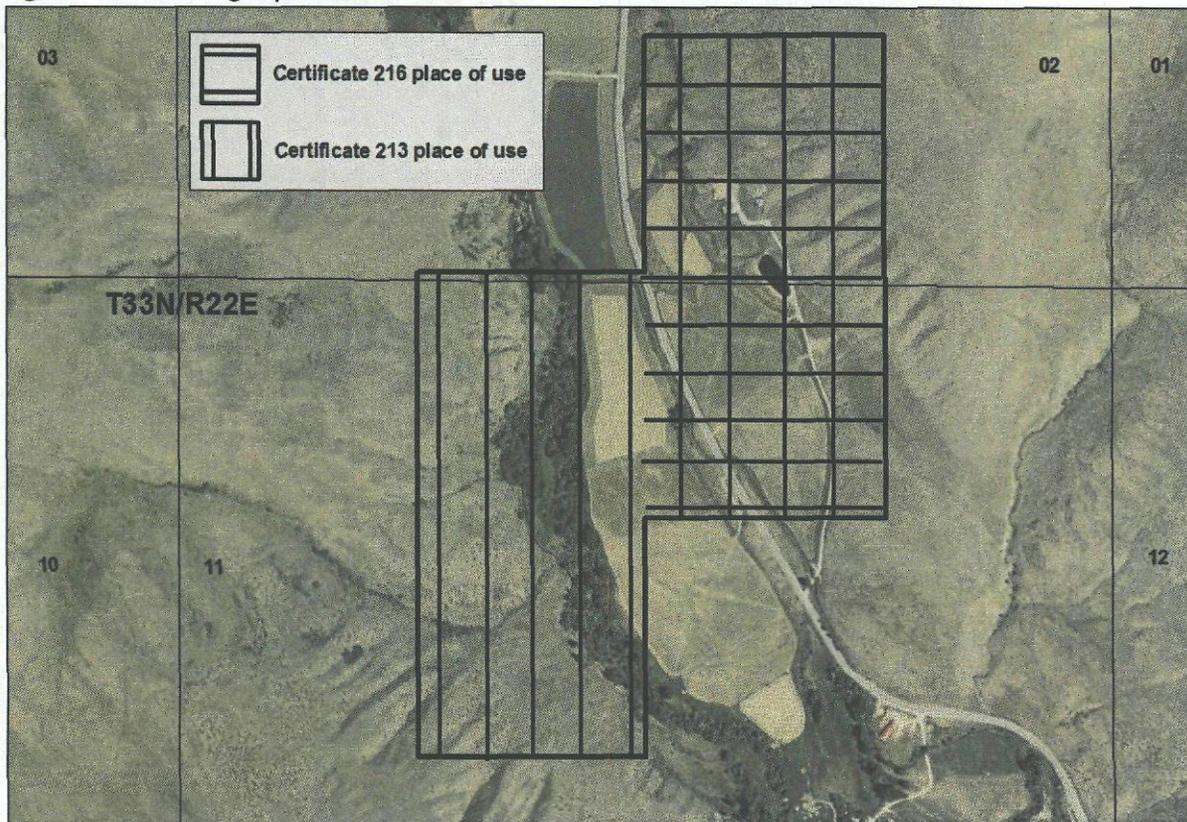

INVESTIGATION

History of Water Use

Beaver Creek and its tributaries were adjudicated in Okanogan Superior Court. Final Decree No. 3935 was issued on September 20, 1921. Certificate 213 was issued to B.J. Batie and authorized water to be diverted from 4 points along Beaver Creek. On August 26, 1970, Certificate of Change, Volume 3, page 1121 was issued that constrained the right to only one diversion point within the SW $\frac{1}{4}$ SE $\frac{1}{4}$ of Section 35, T. 34 N., R. 22 E.W.M., although it appears there may have been a de facto change in point of diversion to the NE $\frac{1}{4}$ SE $\frac{1}{4}$ of Section 35, T. 34 N., R. 22 E.W.M. This point of diversion supplies the Batie Ditch. The additional points of diversion originally authorized for Certificate 213 were also authorized under Certificates 214, 216 and 217: a point within SE $\frac{1}{4}$ SW $\frac{1}{4}$ of Section 2, T. 33 N., R. 22 E.W.M., a point within the SW $\frac{1}{4}$ SW $\frac{1}{4}$ of Section 18, T. 34 N., R. 23 E.W.M., and a point within the SW $\frac{1}{4}$ NE $\frac{1}{4}$ of Section 24, T. 34 N., R. 22 E.W.M. Ecology's Methow River Basin Watermaster, Susan Burgdorff-Beery stated that the Campbells have historically used the Batie Ditch for delivery of all their water rights.

Certificate 213 is a class 2 right that authorizes 0.51 cfs for the irrigation of 27.57 acres within the E $\frac{1}{2}$ NW $\frac{1}{4}$ and the NW $\frac{1}{4}$ NE $\frac{1}{4}$ of Sec. 11, and the SW $\frac{1}{4}$ SE $\frac{1}{4}$ of Sec. 2, all within T. 33 N., R. 22 E.W.M. The Campbells also rely on Certificate 216 to irrigate additional acreage within the place of use for Certificate 213. Certificate 216 is a Class 5 right for the irrigation of 28.1 acres within NW $\frac{1}{4}$ NE $\frac{1}{4}$ of Section 11, and the SW $\frac{1}{4}$ SE $\frac{1}{4}$ of Section 2, T. 33 N., R. 22 E.W.M. Certificate 213 and 216 authorize a total of 53.67 acres (see Figure 1 below).

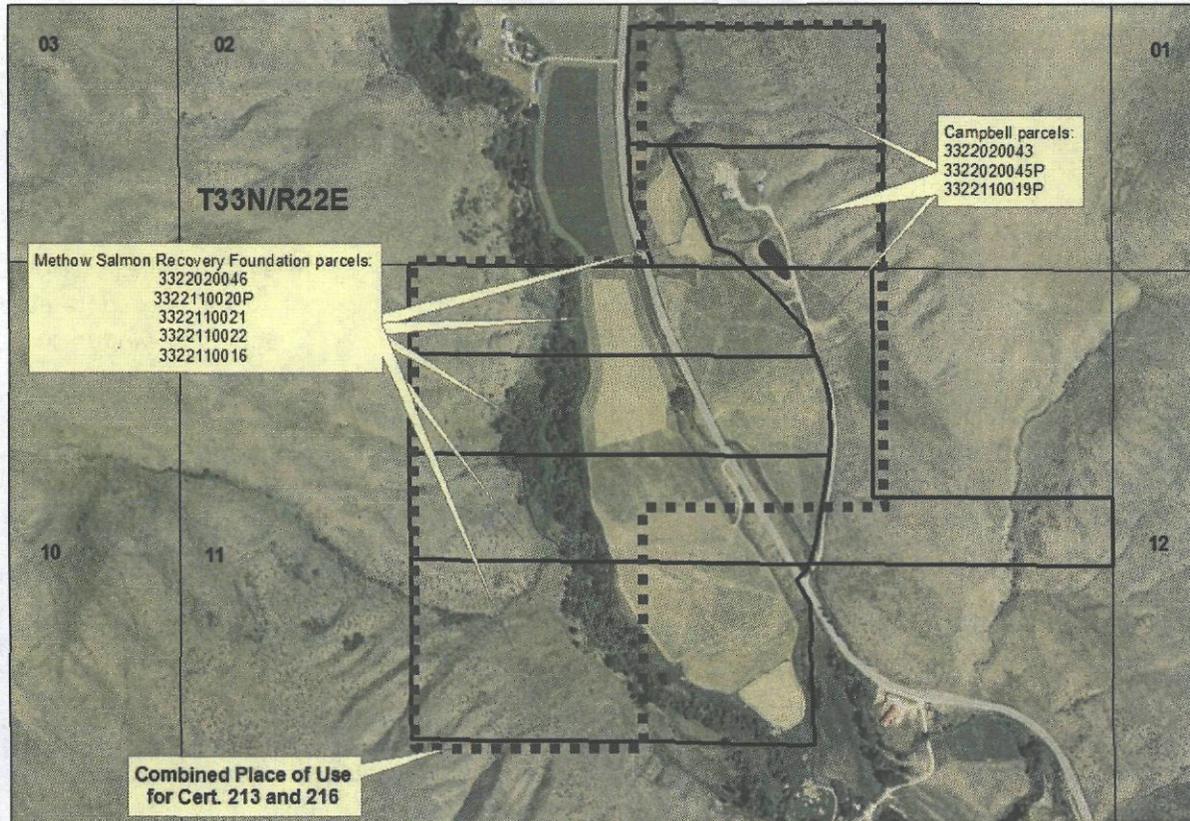

Figure 1: Water Right places of use.

In 2003, the Campbells entered into the Irrigation Efficiencies Grant Program (IEGP) and received funding to install center pivot sprinklers on most of their irrigated acreage. The Campbells submitted applications to temporarily transfer the savings from the new sprinklers to the Trust Water Right Program for portions of Certificates 213, 214, 216, and 217. These applications were accepted by Ecology, but no formal transfer was completed. The contract expired in 2012.

In February of 2011, the Methow Salmon Recovery Foundation (MSRF) purchased several parcels along Beaver Creek including the acres historically irrigated under Certificates 213 and 216 (See Figure 2 below). Within the 160-acre place of use, the Campbells still own parcels that intersect the water right places of use. The purchase and sale agreement between MSRF and the Campbells stated that the property being sold included the water rights that were appurtenant, but that the late season water rights had been sold or leased to TU. However, the water right deed conveying water rights to Ecology was not signed by the Campbells until April 12, 2011.

Figure 2: Parcel ownership and place of use outline.

Site Visit

On April 12, 2012, Steven Hughes of Hart Crowser Consulting (hired on behalf of Ecology) met with Aaron Pervose of TU to observe the original point of diversion from Beaver Creek, the Batie Ditch, irrigated lands, and irrigation methods.

Water diverted from Beaver Creek flows into the Batie Ditch, travels along the valley edge on the eastern side of the creek for several miles to a turnout for the irrigation system used at the authorized place of use for Certificate 213. Alfalfa and grass mix is the predominate crop, but in some years there is a rotational crop or "green crop" planted. At the time of the site visit, which was conducted prior to the irrigation season, no water was being diverted.

Tentative Determination of the Extent and Validity

To change a water right, Ecology must make a tentative determination as to the extent and validity of the right. Under RCW 90.14.160, any portion of a water right not exercised for a period of five successive years, without sufficient cause, shall be relinquished and revert to the state.

To assess the extent and validity of Certificate No. 213, past irrigation practices and water use were evaluated. Susan Burgdorff-Beery, Ecology's Watermaster, indicated that records for Beaver Creek were not kept after 2006. Due to limited water use records, aerial photographs of the site provided a better indicator of extent and validity of the right. Aerial photographs from 1964, 1974, 1989, 2000, 2005, 2006, 2009, and 2011 were reviewed to identify the extent of irrigated lands within the authorized place

of use. A total of 41.2 acres appear to have been historically irrigated within the authorized 160-acre place of use under Certificate 213.

Of the total 41.2 acres historically irrigated within the place of use for Certificate 213, only 25.57 acres are authorized. Certificate 216 authorizes an additional 28.1 acres within the NW¼NE¼ of Section 11, and the SW¼SE¼ of Section 2, T. 33 N., R. 22 E.W.M. Certificate 213 and 216 authorize a total of 53.67 acres. Certificate 213, the more senior class 2 right, is satisfied first. Therefore, the 25.57 acres authorized under Certificate 213 is subtracted from the total irrigated acres leaving a balance of 15.63 acres of beneficial use that can be attributed to Certificate 216 (41.2 – 25.57 = 15.63).

The instantaneous diversion rate (Qi) awarded in the Beaver Creek Adjudication is 0.02 cfs per acre. Therefore the maximum diversion rate associated with 25.57 acres is 0.511 cfs.

The total volume or total irrigation requirement (TIR) for water historically used under Certificate 213 is estimated to be 139.73 ac-ft/yr. This calculation is based on 0.02 cfs per acre:

$$\begin{aligned} 0.02 \text{ cfs} \times 1.98 \text{ ac-ft/day per cfs} \times 138 \text{ days of irrigation} &= 5.46 \text{ ac-ft/yr per acre} \\ 5.46 \text{ ac-ft/yr} \times 25.57 \text{ acres} &= 139.73 \text{ ac-ft/yr} \end{aligned}$$

Annual Consumptive Quantity Test (ACQ)

RCW 90.03.380(1) requires that Ecology perform an annual consumptive quantity test (ACQ) when investigating a water right change proposing additional uses. New uses may be permitted if the change results in no increase in the annual consumptive quantity of water to be used under the water right. The test states that the future consumptive use cannot exceed the average of the two highest years of the last 5 years of continuous use. Based on recent air photos, approximately 25.57 acres have been consistently irrigated under Certificate 213. The water duty associated with those acres is considered the average use for this test.

The historic water use under Certificate 213 is estimated to be 139.73 ac-ft/yr based on the extent and validity analysis above. To identify the consumptive use portion (%CU), Ecology relies on the Washington Irrigation Guide (WIG). The WIG data provides the estimated Crop Irrigation Requirement (CIR), which is the amount of water a crop needs in excess of rainfall. The CIR for alfalfa near the Methow Station is 25 inches (2.08 ft) from May to October. The CIR divided by the TIR equals the application efficiency (Ea%), which is approximately 38% (see calculations below). Another consumptive component is evaporation (Evap%), estimated to be 5% based on Ecology's Guidance 1210. Therefore the Campbell's historic irrigation is estimated to be 43% consumptive. The total consumptive use associated with Certificate 213 is 60.08 ac-ft/yr. The total future consumptive use under Certificate 213 cannot exceed 60.08 ac-ft/yr for both the retained irrigation and the portion proposed to be held instream.

$$\begin{aligned} Ea &= CIR \div TIR \\ Ea &= 2.08 \text{ ft/acre} \div 5.46 \text{ ac-ft/yr per acre} \\ Ea &= 0.38 \\ \%CU &= 38\% + 5\% \\ \%CU &= 43\% \\ CU &= TIR \times \%CU \end{aligned}$$

$$\text{CU} = 139.73 \text{ ac-ft/yr} \times 0.43$$
$$\text{CU} = 60.08 \text{ ac-ft/yr}$$

Trust Water Calculations

This section describes how the portion of water being transferred to instream flows is calculated. The Campbells sold late season water under Certificate 213 and then applied to transfer that water to instream flows in Beaver Creek. The quantity available to be transferred to instream flows is based on the tentative determination above. The late season water associated with 25.57 acres of irrigation under Certificate 213 is available for transfer.

The following sections describe the primary and secondary stream reaches that benefit from water being transferred to instream flows. Each reach is assigned a volume of water based on fallowing of historically irrigated acres August 1 through the end of the irrigation season.

Primary Reach

The primary reach is the portion of the stream that benefits from return flows and what would otherwise be consumed by growing crops. The primary reach extends from the historic point of diversion to the point where return flows historically rejoined the stream adjacent to the southern-most field. The length of the primary reach in Beaver Creek is approximately 2.4 miles long beginning from the point of diversion for the Batie Ditch at river-mile 6.4, and extending downstream to river-mile 4 (see Attachment 1).

The volume of water available for transfer to instream flows in the primary reach is 46.54 ac-ft/yr. This volume is based on the court-awarded instantaneous quantity of 0.02 cfs being diverted over the 46 days of late season irrigation (August 1 through September 15):

$$0.02 \text{ cfs} \times 1.98 \text{ ac-ft/day per cfs} \times 46 \text{ days of irrigation} = 1.82 \text{ ac-ft/yr per acre}$$

$$1.82 \text{ ac-ft/yr per acre} \times 25.57 \text{ acres} = 46.54 \text{ ac-ft/yr}$$

Secondary Reach

The secondary reach is the portion of the stream that benefits only from what would otherwise have been consumed by growing crops. The secondary reach extends from the end of the primary reach to the confluence of the next major tributary, in this case the confluence of Beaver Creek and the Methow River. The secondary reach is approximately 4 miles long beginning at the end of the primary reach at river-mile 4, and extending downstream to the confluence of Beaver Creek and the Methow River.

Historic water use is estimated to be 43% consumptive. Therefore, 0.220 cfs, 20.01 ac-ft/yr is available in the secondary reach (0.511×0.43 and $46.54 \text{ ac-ft/yr} \times 0.43$).

Table 2: Summary of the quantities available for transfer by month.

	Primary Reach		Secondary Reach	
	Qa (ac-ft/yr)	Qi (cfs)	Qa (ac-ft/yr)	Qi (cfs)
August 1-31	31.37	0.511	13.49	0.220
September 1-15	15.17	0.511	6.52	0.220
Total	46.54		20.01	

A maximum of 0.511 cfs, 46.54 ac-ft/yr, may be transferred to instream flows under Certificate 213. Doing so would leave 93.19 ac-ft/yr available to be used for irrigation from May 1 to July 31st (139.73-46.54 ac-ft/yr).

Ditch Operations

The Batie Ditch diversion is utilized to deliver water for Certificates 213, 214, 16, and 217. If all the applications requesting to transfer late season water to instream flows are approved, no water will be diverted under these certificates after August 1st until the beginning of the next irrigation season under and the Batie Ditch headworks will be reduced by 1.736 cfs for at least the next 20 years. This quantity is based on the tentative determinations for all the changes associated with this project.

Table 3: Summary of rights being transferred to instream flows.

Transaction	Application No.	Cert. No.	Qi (cfs)	Qa (ac-ft/yr)
Purchase	CS4-07213J(B)	213	46.54	0.511
20 Year Lease	CS4-07214J(A)(b)	214	31.72	0.348
Purchase	CS4-07214J(B)	214	13.94	0.153
Purchase	CS4-07216J(B)	216	28.45	0.313
20 Year Lease	CS4-07217J(A)(b)	217	5.52	0.061
Purchase	CS4-07217J(B)	217	31.84	0.350
Total			158.01	1.736

Impairment Considerations

The Campbells have agreed to cease diverting water on July 31st of each year and will not begin diverting until May 1st of the following year. Changing the purpose of these late season water rights to instream flows will not result in any increase in consumptive use of water. Rather, the proposed action would decrease future consumptive use. After July 31st, water that would otherwise have been used for irrigation will remain instream to benefit flows. Increased flows should not impair or injure other water rights on Beaver Creek.

Public Interest Considerations

The acquisition of water for instream flows in Beaver Creek is anticipated to improve habitat and survival of listed species in the Upper Columbia ESU.

Consideration of Protests and Comments

A protest letter was received on December 14, 2011 from Bernard and Dianne Thurlow. Their concerns are outlined and discussed below:

- 1) *There is no way to measure the amount of water diverted from the creek because of the large variation in evaporation losses.*

Response: Only the portion of the water right that has been historically used can be transferred to instream flows. Ecology uses the Washington Irrigation Guide (WIG) to approximate water use based on irrigation practices, soils, and crop irrigation requirements. Extensive work has been done by the NRCS to develop specific station data (Methow Station for Beaver Creek crop irrigation requirements) with average monthly precipitation and irrigation requirements by crop type. The WIG data is coupled with GUID-1210, which provides information to evaluate application efficiency ranges, consumptive use, and return flows for crops. These documents allow Ecology to reasonably estimate water usage, including evaporation losses.

- 2) *By leaving water in Beaver Creek and not using it for irrigation you reduce the volume of irrigation water that would eventually infiltrate and be stored in the stream banks. Doing this reduces the volume of water available to discharge from the banks back into the stream during periods of low flow. These actions violate the Referee's Report. The lack of recharge could affect the water availability to the Beaver Creek water users when the creek is normally low, including the fish.*

Response: The proposed project is intended to leave water in Beaver Creek during the lowest flow periods. Fluvial recharge occurs primarily when stream flows are high and the water infiltrates to relatively lower ground water through the stream bed and banks. During the base flows periods (late in the summer and fall), groundwater tends to discharge to the stream.

Applying irrigation water heavily in the early and mid-portions of the irrigation season can store water that flows back to Beaver Creek later in the irrigation season. Applying irrigation water late in the season, during Beaver Creek's base flow period, is less effective in supporting Beaver Creek's streamflow than leaving water in Beaver Creek.

- 3) *Our existing water rights shall not be impaired.*

Response: A water right cannot be changed if the change would impair any other users. Leaving water instream would not harm another water user's ability to access water (see the Impairment Considerations section above).

CONCLUSIONS

It is the conclusion of this examiner that a total of 0.511 cfs, 46.54 ac-ft/yr may be transferred to instream flows under Certificate 213 and that doing so would not impair existing rights in accordance with RCW 90.42.

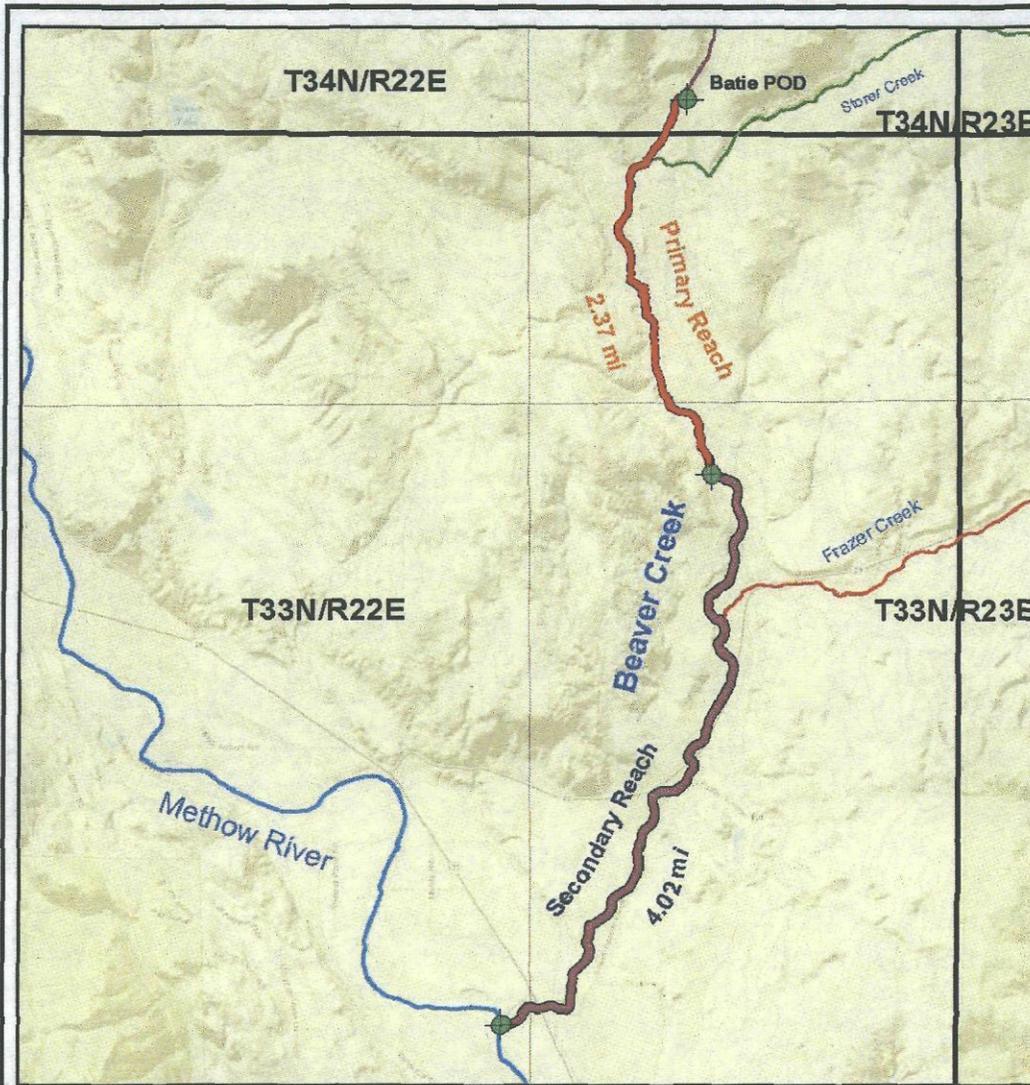

RECOMMENDATIONS

Based on the information presented above, the author recommends that CS4-07213J(B) be approved in the amounts, and subject to the provisions described in the Order for Report of Examination on pages 1-4 in the following quantities:

	Primary Reach		Secondary Reach	
	Qa (ac-ft/yr)	Qi (cfs)	Qa (ac-ft/yr)	Qi (cfs)
August 1-31	31.37	0.511	13.49	0.220
September 1-15	15.17	0.511	6.52	0.220
Total	46.54		20.01
