

Lewis County WATER CONSERVANCY BOARD Application for Change/Transfer Record of Decision

For Ecology Use Only Received: Date Stamp RECEIVED Reviewed by: Date Reviewed: JUL 22 2014

Applicant: City of Centralia

Application Number: LEWI-13-0 1

WA State Department of Ecology (SWRO)

This record of decision was made by a majority of the board at an open public meeting of the Lewis County Water Conservancy Board held on 7/17/14.

Approval: The Lewis County Water Conservancy Board hereby grants conditional approval for the water right transfer described and conditioned within the report of examination on 7/17/14 and submits this record of decision and report of examination to the Department of Ecology for final review.

Denial: The (board name) Water Conservancy Board hereby denies conditional approval for the water right transfer as described within the report of examination on (date report of exam was signed) and submits this record of decision to the Department of Ecology for final review

Signed:

Robert Thode, Chair Lewis County Water Conservancy Board

REPORT

BACKGROUND

On April 18, 2013, the City of Centralia (Centralia) filed five *Applications for Change of Water Rights* to change the points of withdrawal/diversion of several water rights and modify the place of use to reflect the current configuration of the irrigated property. **The intent of these *Applications for Change* is to allow the City the flexibility to exercise their water rights by irrigating different areas than currently authorized under these certificates. Under these requested changes water will be co-mingled in a single irrigation system and applied to the entire property, subject to the individual limitations of each water right.**

This Report of Examination will address Ground Water Certificate 535-D. The application was accepted at an open public meeting of the Lewis County Water Conservancy Board ("Board") on April 18, 2013, and assigned application number LEWI-13-01.

Below are all five *Applications for Change* with corresponding WCB numbers.

Water Right Number	Original Water Right Holder	Lewis County WCB Number
535-D	Ticknor	LEWI-13-01
536-D	Ticknor	LEWI-13-02
2144	Mott	LEWI-13-03
2324	Ticknor	LEWI-13-04
G2-21004	Walsh	LEWI-13-05

Exhibit "A" is a copy of the Application for Change No. LEWI-13-01, and **Exhibit "B"** is a copy of Ground Water Certificate 535-D.

SEPA

The Board has reviewed the proposed project in its entirety. The governmental action relating to the subject application is exempt from the "detailed statement" preparation requirements of SEPA (WAC 197-11-800(4)). A water right application or if applicable an *Application for Change of Water Rights* is subject to a SEPA threshold determination (i.e., an evaluation whether there are likely to be significant adverse environmental impacts) if any one of the following conditions are met.

- It is a surface water right application for more than 1 cubic feet per second, unless that project is for agricultural irrigation, in which case the threshold is increased to 50 cubic feet per second, so long as that irrigation project will not receive public subsidies;
- It is a groundwater right application for more than 2,250 gpm
- It is an application that, in combination with other water right applications for the same project, collectively exceed the amounts above;
- It is a part of a larger proposal that is subject to SEPA for other reasons (e.g., the need to obtain other permits that are not exempt from SEPA);
- It is part of a series of exempt actions that, together, trigger the need to do a threshold determination, as defined under WAC 197-11-305.

None of these situations applied to this application.

Other

Chapter 90.44 RCW authorizes the appropriation of public water for beneficial use and describes the process for obtaining water rights including the process to amend or change existing rights. Laws specifically governing the water right permitting process are RCW 90.03.250 through 90.03.340 and RCW 90.44.060. Changes or amendments to these rights are covered under RCW 90.03.380 and RCW 90.44.100.

The information or conclusions in this section were authored and/or developed by Barbara Burress

Public Notice/Comments and Protests

Public notice of the application was given in the Chronicle on April 25th, and May 2nd, 2013. The protest period ended on June 2nd with an extended opportunity for public discussions during the review process.

Since the intent of these filings is to modify the place of use to allow for irrigation in both Thurston and Lewis Counties a public meeting was also held at a Thurston County venue on July 15, 2013, specifically the regularly scheduled meeting of the Thurston County Water Conservancy Board. No protests were received in response to the public notice, nor did members of the public attend the meetings where these applications were discussed.

"Exhibit C" is the Affidavit of Publication.

The information or conclusions in this section were authored and/or developed by Barbara Burress

INVESTIGATION

The following information was obtained from:

- A site inspection conducted by Commissioners Barbara Burress and Bob Thode on July 18, 2013. The group was accompanied by Jim Webb farm manager for the City of Centralia, and Jill Van Hulle of Pacific Groundwater Group. A written report documenting the site visit was prepared by the Board and is included in this record.
- Technical reports including Drost, B.W., Ely, D.M., and Lum, II, W.E., 1999. "Conceptual Model and Numerical Simulation of the Ground-Water-Flow System in the Unconsolidated Sediments of Thurston County, Washington". U.S. Geological Survey WRI 99-4165
- Research of Ecology records - including water rights, well construction logs and other hydrogeologic information and,
- Conversations with the applicant specifically Public Works Director Kahle Jennings and Farm Manager Jim Webb.
- Additional technical information provided to the Lewis County Water Conservancy Board, in a March 18, 2013 memo from Dawn Chapel, LHG entitled *Hydrogeological Assessment of Flying T Property*. (See Exhibit "D")

Project Description

The project site is known as the City of Centralia's Flying T property. The project site encompasses about 305 acres and is located at 1101 Goodrich Road, northwest of the City of Centralia, in Sections 23 and 26, Township 15 N., Range 3 W.W.M. The Chehalis River forms the western boundary of the site, and the farm project is mostly located in Lewis County with a smaller portion situated in Thurston County.

This property is currently occupied by the City's wastewater treatment plant (WWTP) facility, but prior to 2003, was operated as the Flying T Ranch. While none of these water rights have ever been officially modified, water use on the property has changed. While once managed as at least 4 separate farms these properties were combined in the mid-1980's under the ownership of Maxwell Baxter.

Over time, the use of some of the originally designated wells and diversions have been discontinued, and the owners have shifted to the use of other on-site wells. The property has been in continuous agricultural production for nearly 100 years, and numerous crop types have been produced. While the WWTP facility has displaced some of the original fields, most of the property remains in active farm production.

Four main wells are currently used to irrigate this property. These wells are referred to by City staff as the Walsh, Pratley, Peterson, and Treatment Plant Area wells. The intent of these *Applications for Change* is to allow the City the flexibility to exercise their water rights by irrigating different areas than currently authorized under these certificates and where appropriate to change the point of withdrawal to reflect the active production wells that are currently in use. These changes are being filed to bring the City into compliance with current operations. Under these requested changes water will continue to be co-mingled in a single irrigation system and applied to the entire property, subject to the individual limitations of each water right. No rights are being transferred from the farm property.

This change request is specific to Ground Water Certificate 535-D (Priority Date July 1943). The certificate authorizes the withdrawal of 128 gpm, and 80 ac-ft/yr for the irrigation of 40 acres from what is referred to as Dug Well 1. Dug Well 1 is no longer used and believed to be located somewhere under the footprint of the Waste Water Treatment Plant (WWTP). The City wishes to change the point of withdrawal to the Walsh Well and modify the place of use to allow for irrigation of the entire property. Approximately half of the original place of use described by this certificate is covered by the WWTP and irrigation has shifted to fields further to the north – generally referred to as the Stump Field, as well be discussed further in this report.

The Walsh Well is the City's northernmost source and the original place of use is limited to property located on the Thurston County side of the property. This well is, however, used in conjunction with the Peterson well to irrigate property to the east, as well as portions of the property to the south. Were other wells to become inoperable the City could use this well to supply water anywhere on the property provided the total irrigated area did not exceed the authorized amounts, however the well will not generally be used to irrigate the more southern portions of the property simply because it would not be efficient to convey water to the more southern portions of the site when other production wells are better located.

Other water rights appurtenant to the property

The City of Centralia holds multiple water right authorizations for the irrigation of this property but has elected to only modify five of the water right documents. The remainder of these rights are either useable *as issued* or not needed due to redundancy with other water rights. **Table 2** lists all the water rights appurtenant to the project based on a review of Ecology's records, with the right currently proposed for change bolded.

Evaluation

A more detailed description of all water rights appurtenant to City's property is included in supporting materials associated with this application, see "Exhibit F".

With the approval of the City's five *Applications for Change of Water Rights* we suggest that the Flying T water right portfolio will be as follows, again with the modified rights in bold:

Table 3 – Revised Flying T Water Rights

Cert #	Person	Type	Date	Purpose	Qi		Qa		Ir Acres	Well

					1,700 gpm		503.7		252	

*Water Right Certificates to be used "as-is" without further modification

Consistency with Place of Use

We note that of the approximately 304 acres owned by the City, all but 20 acres are described in the place of use by one or more of the certificates. This 20-acre portion encompasses the northernmost part of what the City refers to as the "Stump" and "Peterson" Fields and we can find no explanation as to why water rights have been excluded from this particular portion of the property. The City has always assumed that all of the Flying T property was covered by water rights, and to the best of City staff's knowledge the entire property has always been irrigated. In filing this change request the City is requesting that a single place of use be established that encompasses all currently irrigated areas – include the 20 acres that was previously not covered by a specific water right.

Groundwater Certificate 535-D allows for the irrigation of 40 acres, approximately half of that previously irrigated area currently houses the foot print of the wastewater treatment plant and it appears that irrigation has shifted to the north to cover the Stump Field area. While the irrigation of areas outside of the original place of use was not previously authorized, it appears that the water right was exercised in a manner *for the most part* consistent this water right, and the issue can be resolved today through this requested modification. We find that the City's request does not constitute an expansion of water rights because while the authorized place of use describes approximately 304 acres the rights are still limited to something less – we have estimated that to be approximately 252 acres of irrigation of which 227 is authorized under the 5 certificates proposed for change by the City.

With the approval of these requested changes the City may irrigate anywhere within the new place of use under 535-D, 536-D, 2144, 2324 and G2-21004 provided that the total number of acres does not exceed 227 acres during any season. Other right appurtenant to the property allow for the irrigation of an additional 25 acres.

In filing these *Applications for Change* the City is creating a single place of use that will become uniform across all five certificates associated with this consolidation effort. Accordingly these rights will no longer include discreet places of use as they did previously. The City has no intention to sub-divide this agricultural property and understands that in the unlikely event that land use conditions change and subsequent modifications are required, that further actions may be required.

Effects to Other Water Rights/Claims

The State Department of Ecology's Water Rights Application Tracking (WRATS) database was queried to identify other existing ground water rights (certificates, permits and claims) situated near the Flying T site. Exhibit "E" shows that nearly 170 records on file are within the 4 square miles encompassing and surrounding the Flying T property. Many of these documents were filed as claims for general domestic purposes, but numerous water rights and claims represent irrigation or stockwatering purposes which are consistent with the land use patterns on the area.

Table 3 below details water rights within an approximate ½ mile radius of the new point of withdrawal associated with this transfer which is the Walsh Well located in the S ½ of the SW ¼ of Section 23.

Table 3 – Water Rights Application Tracking – ½ Mile Radius of Proposed Walsh Wellsite

Purposes of use: IR – irrigation, DS – single domestic

Given the high productivity of the surficial aquifer, pumping of shallow groundwater wells at the Flying T property is not expected to interfere with the operation of other wells in the area. The potential for impairment was assessed using a Theis distance drawdown analysis with the following aquifer parameters and pumping assumptions:

- Aquifer hydraulic conductivity = 310 ft/day (based on median value for the Outwash aquifer reported in Ecology, 2005).
- Aquifer thickness = 56 ft (based on average thickness of Outwash aquifer reported in Ecology, 2005).
- Aquifer Storativity = 0.25 (a typical value for sand and gravel).
- Assumed pumping rate of 500 gpm operating for 6 months (irrigation season).

The analysis indicates 3-ft of drawdown would occur after 6 months of pumping at the pumping well and less than 1-ft of drawdown would occur in the aquifer about 240 feet from the well.

The available drawdown in other wells in the area ranges from 20 to 52 feet with an average of 38 feet (based on 19 well logs in Section 26). Given the minimal drawdowns calculated above, the usage of groundwater wells at the Flying T property is not expected to interfere with the operation of other wells in the area.

Transferring the point of withdrawal from GWC 535-D across the farm to allow for increased withdrawals at the Walsh well will not impair other water right holders. The new point of withdrawal is an existing well that is already operated under the authority of groundwater certificate G2-21004. The well is currently equipped and permitted to pump 500 gpm, and the rate of withdrawal is not actually being increased as a result of this change. Accordingly, we recommend this transfer be conditioned on the total rate of withdrawal from the Walsh well – under all currently appurtenant water rights not exceeding 500 gpm.

Hydrogeological Setting

The Flying T property is located within the Chehalis River Valley in the Puget Sound Lowland; an elongated structural basin extending from the Cascade Range to the Olympic Mountains. During the Eocene to Miocene Epochs (~45 to 5 million years ago), tectonic processes resulting in land subsidence enabled large deposits of marine, brackish water, and non-marine sediments and volcanic rocks to accumulate in the area now occupied by the Chehalis Valley (Ecology, 2005). These rocks were later deformed during the Pliocene Epoch (5.3 to 1.6 million years ago) into the dominant southeast-northwest trending synclines and anticlines that characterize the present geologic structure of the area (Ecology, 2005).

During the Pleistocene Epoch (1.6 million to 10,000 years ago) the Puget Sound Lowland was repeatedly inundated by advancing ice from the Puget lobe of the Cordilleran ice sheet. The most recent glacial advance occurred during the Vashon Stage of the Frasier Glaciation about 15,000 years ago (Ecology, 2005). Although Vashon ice never reached the Chehalis Valley, melt water from the glacier deposited large quantities of coarse-grained outwash deposits on the valley floor as far south as the present Chehalis and Skookumchuck river confluence (Ecology, 2005). In many locations the outwash deposits are overlain by modern river and stream deposits (alluvium) of fine gravel, sand and silt (Ecology, 2005).

The following Hydrogeologic Units occur beneath the Flying T property.

- Recent Alluvium (Qa) which occurs at the land surface. This material is comprised mostly of silt, sand and fine gravel but locally includes fine-grained deposits of sand, silt, and clay. It is about 22 feet thick on average and varies from a thin veneer to 80 feet (Ecology, 2005). The Qa serves as a surficial semi-confining unit to the generally coarser grained outwash aquifer below (Qgo(g)). The Qa produces small to moderate amounts of water from sand and gravel interbeds contained within it (Ecology, 2005).
- Vashon Recessional Outwash (Qgo(g)) is the primary water supply aquifer in the area of the Chehalis River Valley where the Flying T property is located. It is composed of coarse-to-medium gravel, sand, cobbles, and occasional boulders, with localized layers of silt and clay (Ecology, 2005). It is about 56 feet thick on average and varies from 6 feet to 91 feet thick (Ecology, 2005). In the vicinity of the Flying T property, the Outwash aquifer is underlain by undifferentiated older Tertiary aged bedrock (Tbu) consisting of consolidated siltstone, sandstone, shale, and volcanic rocks.

Collectively, the unconsolidated hydrogeologic units above the Tertiary bedrock are referred to as the surficial aquifer (Ecology, 2005). Ecology's 2005 study of the Centralia-Chehalis area surficial aquifer indicates that groundwater in the shallow aquifer system is in close hydraulic connection to the rivers throughout most of the valley.

A water table map based on 2004 water level data from numerous monitoring wells in the valley, indicates the groundwater flow direction on the Flying T Ranch property is westward towards the Chehalis River (Plate C, Figure C-1, Ecology 2005). Furthermore, a September 2003 seepage study was conducted along a 6.3 mile reach of the Chehalis River along the Flying T Ranch property - from the mouth of Lincoln Creek (near the south end of the Flying T Ranch property) to USGS gaging station 12027500 (about 0.5 miles north of the Flying T Ranch property). The results of the seepage study indicated this stretch of the Chehalis River is a gaining stream (net gain of about 31 cubic-feet-per-second) - meaning groundwater discharges along this reach of the river and contributes to its baseflow (Ecology, 2005). The findings of the seepage study are further supported by in-stream piezometers installed for the Ecology study which indicated an upward vertical gradient consistent with a gaining stream (Plate C, Ecology 2005).

The Ecology 2005 study includes a geologic cross-section through the Flying T Ranch property (A to A' in Plate A, Ecology 2005). That cross section indicates the study area is underlain by about 80-ft of Outwash sand and gravel with a thin veneer of alluvial deposits, which comprise the shallow aquifer system. The shallow aquifer system is underlain by low permeable Tertiary aged bedrock consisting of low permeable sandstones, siltstones, shales, claystones, and conglomerate beds (Ecology 2005). These low permeable units retard downward movement from the shallow aquifer system.

Review of Section 26 well logs in the vicinity of the Flying T site show well depths range from 20 to 60-ft. Geologic descriptions on the well logs indicate sand and gravel with cobbles and occasional silt and clay. Static groundwater levels at time of drilling range from 7 to 21 feet below ground surface (bgs). These descriptions are consistent with the hydrogeologic interpretations presented in the USGS (1999) and Ecology (2005) groundwater studies which indicate the Chehalis River valley is underlain by a productive shallow aquifer system consisting of sand and gravel glacial outwash deposits overlain by a veneer of more recent alluvial deposits.

Supply Sources and Same Body of Public Water

Table 4 designates the location of the originally designated source of supply and the proposed new source. As has been previously discussed numerous wells have been constructed on the Flying T property. Some of these wells are clearly associated with water rights – including rights associated with the property that are not proposed to be changed and the City's currently pending Applications for Change. Other well have been constructed without specific authority, and are used to exercise previously issued water rights.

Table 4 - Authorized and Current Sources

Cert #	Owner	Authorized Source	New Source
2144	MOTT H	CHEHALIS RIVER (1500 ft East and 1,150 ft North of SW corner of Sec 26, T.15 N., R 3W)	Pratley Well
2324	TICKNOR R B	CHEHALIS RIVER (750 ft north and 1,200 ft west of the center of Sec 26, T.15 N., R 3W)	Pratley Well
535-D	TICKNOR R B	Dug Well 1 (660 ft West and 660 ft South from NE corner of SW ¼ of NE ¼ of Sec. 26, in the SW ¼ NE ¼ of 15 N 3W, S. 26)	Walsh Well
536-D	TICKNOR R B	Dug Well 2 (660 ft east from the NE corner of SW ¼ NE ¼ of Sec 26 in the N ½ NE ¼ of 15 N 3W, S. 26)	Peterson Well
G2-21004C	WALSH LEO & BEVERLY	Walsh Well (1290 ft north and 510 ft west of the south quarter corner of Sec 23 in the SE ¼ SW ¼ of 15 N 3W, S. 23)	No change proposed to POW

For the purpose of assessing impairment and addressing same body of public groundwater there are three wells that need to be considered – the Pratley well which is currently unpermitted but will be used to exercise both surface water certificates 2144 and 2324, the Peterson Well which will be used to exercise groundwater certificate 536-D which was previously exercised from a dug well, and the Walsh Well which will be used to exercise groundwater certificate 535-D which was associated with another dug well.

This specific ROE has been drafted for GWC 535-D and addresses the transfer of a water right from Dug Well 1 to the Walsh Well. Dug Well 1 was located in the SW ¼ NE ¼ of Section 26 beneath what is today the Waste Water Treatment Plant (WWTP). The source is no longer in use and has been decommissioned. There is no formal record of construction but an after-the-fact log was filled out perhaps in association with water right process. It is believed that the well was a dug well approximately 30 feet deep by 20 feet wide that yielded approximately 128 gpm. The new withdrawal point is the Walsh Well located approximately 1,500 feet to the northwest of the original site. There is no well log available for the Walsh well but the report of examination indicates that the well was constructed with a 12-inch casing and completed at a depth of 50 feet. The well is equipped with a 25 hp electric centrifugal pump and has been equipped to produce 500 gpm. The Walsh and Dug Well 1 are both completed in the same body of groundwater which is composed of the unconsolidated hydrogeologic units above the Tertiary bedrock or the surficial aquifer. Ecology's 2005 study of the Centralia-Chehalis area surficial aquifer indicates that groundwater in the shallow aquifer system is in close hydraulic connection to the rivers throughout most of the valley, which is consistent with the high static water levels and productive nature of these wells.

Water Availability and Impairment of Flows

Minimum instream flows for this area were established through Chapter 173-523 WAC, the Instream Resources Protection Program for the Chehalis River Basin, (WRIA 22 and 23). The stated purpose of the rule is to retain perennial rivers and streams with instream flows and levels necessary to provide for wildlife, fish, scenic-aesthetic, environmental values, recreation, navigation, and water quality. Under the provisions of these regulations, any consumptive groundwater withdrawals from these basins with priority dates later than the closure dates stated in the regulations must not have an adverse effect on regulated surface water bodies.

The subject certificate has a priority date of 1943 and predates the instream flow rule. While Ecology does have the authority to condition water rights with instream flows during the change process, there needs to be a change in the nature of the water use such that the new use has a potential to impact flows differently. For example a change in period of use would trigger conditioning the change authorization with instream flow, as would a change in point of diversion upstream on a regulated surface water body. Since the applicant is only shifting the point of withdrawal to allow for continued irrigation of the same lands we see no requirement to add instream flow provisions which would encumber this water right unduly.

Public Interest

The proposed transfer is subject to RCW 90.44.100 and therefore, cannot be detrimental to the public interest. Ecology considers public interest to include the ramification of water right decisions on any watershed planning activities.

The 1971 Water Resources Act provides the most comprehensive list of legislative policies that guide the consideration of public interest in the allocation of water. These policies generally require a balancing of the state's natural resources and values with the state's economic well-being. Specifically, the policies require allocation of water in a manner that preserves instream resources, protects the quality of the water, provides adequate and safe supplies of water to serve public need, and makes water available to support the economic well-being of the state and its citizens.

The proposed change – which will result in the relocating of an already permitted well, is consistent with state policy without adversely impacting instream flows or other public needs and values. No detriment to public interest could be identified during the examination of the subject application.

Tentative Determination

Applications for Change are governed, in part by RCW 90.03.380, which states that water rights that have been put to full beneficial use may be transferred to another place of use without loss of priority if such change can be made without detriment or injury to other existing rights.

When an Application for Change is filed, County Water Conservancy Boards are required by law to perform what is called a "tentative determination." This involves verifying that the right is in good standing and eligible to be changed ("good standing" means that Ecology can verify that water has been used within the last 5 years, that the water right has not been cancelled, and that development schedule has not lapsed and assessing the historical purposes of use.

Whole or partial relinquishment may occur when all or part of the authorized quantity has not been used for 5 years, respectively.

Good Standing:

At the heart of the City's filings is the desire to have these water rights reflect actual water use on the site. As previously mentioned these water rights are old and over time wells have been decommissioned and new wells drilled, new facilities have been constructed and property has been bought and farming consolidated.

The Department of Ecology's policy on tentative determinations of water rights (*Water Resources Program Policy for Conducting Tentative Determinations of Water Rights, Policy POL 1120*) provides that water rights may still be found to be in good standing even if not exercised exactly as issued. Changes that were made to water rights without first being authorized by Ecology are commonly called "de facto", or after-the-fact changes.

POL 1120 provides that when evaluating unauthorized changes to water rights, the Department of Ecology generally considers beneficial use to be the measure of the right, even if some attributes of the right may not be consistent with the current authorization. Use of water in a manner inconsistent with one's water right authorization may not result in forfeiture or abandonment of that right, provided such use is beneficial and not wasteful.

However, determining whether the beneficial use is associated with the right proposed for change can be difficult depending on the unauthorized changes that have occurred. For example, an unauthorized change in point of diversion may be relatively easy to investigate, whereas an unauthorized change in purpose or place of use may be very difficult to investigate. Consideration of unauthorized water use as representing beneficial use of the water right is determined on a case by case basis, through examination of the specific fact pattern associated with the water right file.

In the case of the City of Centralia's filings there are two types of Defacto Changes – place of use and point of diversion or withdrawal.

The following factors support the City's position that the rights remain in good standing:

- The City and previous owners realized that they had water rights and actively used water of the property for the originally intended purposes. We see no evidence of non-use or significant overuse with all irrigation occurring within the original bounds of the Flying T project. Groundwater Certificate 535-D allows for the irrigation of 40 acres, approximately half of that previously irrigated area currently houses the foot print of the wastewater treatment plant and it appears that irrigation has shifted to the north to cover the Stump Field area. While the irrigation of areas outside of the original place of use was not previously authorized, it appears that the water right was exercised in a manner *for the most part* consistent this water right, and the issue can be resolved today through this requested modification.

- The sources are all very similar in construction such that no impairment would be expected from shifting production between the wells. All the wells are completed in the same body of public ground water which is hydrological coupled with the nearby Chehalis River. Use of one well over another has no discernible impact on stream flows or other water users.

Beneficial Use:

There are several methods to assess water use with meter readings being the preferred and most reliable mechanism. In situations where meter records are not available applicants can attempt document water use by other means. Beneficial use includes an evaluation of the actual numbers of acres irrigated as well as the amount of water that would have been applied.

Irrigation

Water use on the property is not metered, but generally applied in a manner consistent with the water rights that provide a water duty ranging from 1 to 2 acre-feet per irrigated acre during the growing season. Power records appear inconclusive except to document service connections to the well. The City employs a full-time farm manager – Jim Webb, who is tasked with managing farming activities on the site.

After its acquisition the City used the property to grow corn for several years, but now grows mainly pasture grasses that are cut for hay. The City owns three Nelson Travelling Big Gun sprinklers – 2 with diesel motors and booster pumps, and 1 with an 8-hp gas motor. The first two are used with the Walsh and Peterson wells and the latter with the Pratley well (the Pratley well is operated with a trailer mounted diesel motor and has adequate pressure without boosters).

Each gun can irrigate a swath 1,100 feet by 230 feet or approximately 6 acres, (253,000 square feet). Mr. Webb monitors water application using a small portable rain gage. He generally allows 1.5 inches to fall on the ground before moving the sprinklers to make the next pass which usually takes approximately 14 to 16 hours. He usually tries to keep two guns going at a time – weather dependent. There are approximately 30 irrigation risers on the property and irrigation generally begins in June and continues through the end of September.

Number of Acres Irrigated Water Duty and Irrigation Calculations

The intent of this requested change is not to increase the number of acres irrigated under any single water right but to provide a single place of use that can be irrigated under any of the water rights associated with the project.

For the purposes of evaluating water use at this site we have looked at both total project irrigation, as well as reviewed what each individual water right authorizes. We have assumed that, within this 304-acre footprint, approximately 252 acres could reasonably be irrigated. This figure accounts for non-irrigable areas of buildings, roads, the water treatment plant area, and larger swathes of riparian habitat along the Chehalis River.

GWC 535-D allocates 80 acre-feet for the irrigation of 40 acres, which is based on a standard water allocation of 2 acre-feet per irrigated acre. This quantity doesn't always reflect actual water use, however and the Conservancy Board is required to assess the extent of actual beneficial water use and make a tentative determination as to actual water use. We have determined that between the original place of use and the areas that our irrigated to the north of the treatment plant, that 40 acres have been irrigated and this water right is in good standing. This Application for Change is being filed after-the-fact, but we still find it approvable based on underlying beneficial use.

For property that has clearly been irrigated, the Washington Irrigation Guide (WIG) is frequently used to determine what a reasonable water duty would have been with the assumption being that farm operators would have applied as much water as needed to maintain their crop. This approach is consistent with standard Ecology methodology, as outlined in Ecology Guidance Document Guide-1210. Table 5 below provides an estimation of water use based on the irrigation of pasture using a Big Gun style sprinkler.

Table 5 – Projected Water Use under GWC 535-D

# acres	Crop Requirement in inches (WIG)	Crop Irrigation Requirement (af/year)	Total Irrigation Requirement (af/year)	App. Efficiency (%)	% Total Evaporated	Total Consumed (af/year)	Return Flow (af/year)
40	16.28 inches	54.27	83.49	65	10	62.62	20.87

Of these calculations, the key quantity is the Total Irrigation Requirement which reflects the amount of water that would have needed to adequately irrigate 40 acres based on climatic conditions in the Centralia area. While some of that water would have resulted in return flow, we have assumed a reasonable irrigation efficiency and we find that 83.5 acre-feet could have been put to beneficial use. Since that quantity actually exceeds Ecology's allocation of 80 acre-feet per year we find that this right has been fully perfected and is eligible to be transferred.

Consideration of Comments and Protests

No public comment or formal protests were received at either regularly scheduled Lewis County WCB meetings or at the Thurston County meeting, however members of the Thurston County Water Conservancy Board did comment that they are concerned in general about the transfer of water rights from Thurston to Lewis County and that they would like to see special attention paid to providing public notice to adjacent property owners. The Lewis County Board notes that while one of the five

certificates involved in the transfer specifies a Thurston County wellsite and place of use that the intent of these transfers is to continue to irrigate the same property and no transfer of water to a different site is being proposed. Public notice was duly conducted in accordance with State regulations, but more importantly neighboring property owners will not be impacted by these modification to the City's water rights.

The information or conclusions in this section were authored and/or developed by Jill Van Hulle and Dawn Chapel of Pacific Groundwater Group in consultation with Barbara Burres

CONCLUSIONS

Tentative determination (validity and extent of the right)

The Board finds this water right to be in good standing and eligible to be changed in the original authorized annual quantities.

Relinquishment or abandonment concerns

The Board finds no evidence that this right has been relinquished. This right is considered to be in good standing. We suggest however that since the rate of withdrawal was never actually increased at the point of withdrawal that the Qi associated with this water right be considered as non-additive.

Hydraulic analysis

Based on the information presented above, the proposed new well and the existing well designated by the water right certificate, as well as other onsite wells targeted for modification - all share a common water body, and can be transferred without impacts to instream flows and existing water users.

Impairment

Operation of the proposed well at its targeted rate of 500 gpm will not impact other water users.

Public Interest

The relocation of an already permitted well site to this location is consistent with state policy without adversely impacting instream flows or other public needs and values. No detriment to public interest could be identified during the examination of the subject application.

The information or conclusions in this section were authored and/or developed by Barbara Burres

DECISION

Based on conclusions above, the decision of the Board is to approve the City of Centralia's *Application for Change* and to make the following changes to Ground Water Certificate 535-D:

- The point of withdrawal shall be the Walsh Well designated on the second page of this recommendation.
- The purpose of use shall be designated as irrigation of 40 acres.
- The Qi of this water right is 128 gpm, however that quantity should be designated as non-additive such that total withdrawals from the Peterson Well do not exceed 500 gpm, the Qa is 80 acre-feet based on climatic conditions and irrigation infrastructure.
- The place of use is the footprint of the Flying T project site as described on page 2 of this recommendation.

PROVISIONS

Metering Requirements:

An approved measuring device shall be installed and maintained for each of the sources authorized by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use", Chapter 173-173 WAC. <http://www.ecy.wa.gov/programs/wr/measuring/measuringhome.html>

Water use data shall be recorded monthly. The maximum monthly rate of diversion/withdrawal and the monthly total volume shall be submitted to the Department of Ecology by January 31st of each calendar year.

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the project location, and to inspect at reasonable times, records of water use, wells, diversions, measuring devices and associated distribution systems for compliance with water law.

Chapter 173-173 WAC describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition the Department of Ecology for modifications to some of the requirements

Conditions and limitations

N/A

Construction Schedule/Proof of Appropriation

The water right holder must file the notice of Proof of Appropriation of water (under which the superseding certificate of water right is issued) when the permanent distribution system has been constructed and the quantity of water required by the project has been put to full beneficial use. The superseding certificate will reflect the extent of the project perfected within the limitations of the change authorization. Elements of a proof inspection may include, as appropriate, the source(s), system instantaneous capacity, beneficial use(s), annual quantity, place of use, and satisfaction of provisions.

The development schedule established by the Department of Ecology requires the filing of the Proof of Appropriation by March 1, 2015.

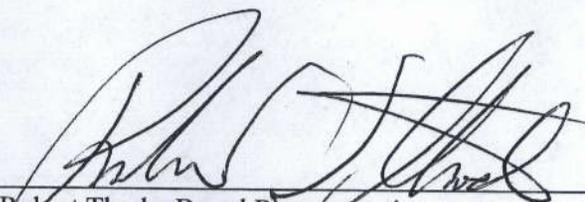

Conditions and limitations

Prior to the onset of the irrigation season the City of Centralia will provide Ecology with an irrigation plan that indicates which portions of the property will be irrigated under these revised water rights.
