LEGAL DESCRIPTION OF AUTHORIZED PLACE OF USE

All those portions of Section 15, Township 35 North, Range 6 East, W.M., described as follows:
The South 1/2 of the Northwest 1/4 of said Section 15 AND the West 1/2 of the Southwest 1/4 of the Southwest 1/4 of said Section 15, LESS ROADS.

All those portions of Section 16, Township 35 N, Range 6 E, W.M., described as follows:
The South 1/2 of said Section 16, AND the South 183 ft of the Southeast 1/4 of the Northwest 1/4 of said Section 16 lying South of Jims Slough (AKA Etach or Minkler Creek), AND the South 485 feet of the Southwest 1/4 of the Northeast 1/4 lying South and West of said Jims Slough, AND the Southeast 1/4 of the Northeast 1/4 of said Section 16 lying South of County road and West of the following described line: Beginning at the East 1/4 corner of said Section 16, thence West along the East and West Centerline of said Section 16 389 ft, thence N 1°47'2" E 120 ft, thence N 8°54'36" W 1184 ft to the South line of County road, LESS the East 363 ft of the Northwest 1/4 of the Southeast 1/4 of said Section 16, AND LESS the South 310 ft of the East 516 ft of the Southwest 1/4 of the Southeast 1/4 of said Section 16 lying northeasterly of county road, AND LESS ROADS.

All those portions of Section 21, Township 35 N, Range 6 E, W.M., described as follows:
The North 1/2 of said Section 21, lying North of the Skagit River, LESS those portions of lot 3 and lots 7-15 of the Plat of Heart O' Skagit River Tracts lying in said Section 21, AND LESS ROADS.

All those portions of Section 22, Township 35 N, Range 6 E, W.M., described as follows:
The West 1/2 of the Northeast 1/4 of said Section 22, lying North and West of the Skagit River, AND the West 1/2 of said Section 22, lying North and West of the Skagit River, LESS those portions of lots 15-36 of the Plat of Heart O' Skagit River Tracts lying in said Section 22, AND LESS ROADS.

Proposed Works

USGE uses 6 wells, and a small pond to irrigate its Cockreham Island project. Each well serves an individual pressure zone with the surface water pond being used for a nursery area. Micro-drip tape with individual emitters, and a computerized irrigation system.

Development Schedule

BEGIN PROJECT	COMPLETE PROJECT	PUT WATER TO FULL USE
Started	Completed	January 1, 2021

Measurement of Water Use

How often must water use be measured?	Monthly
How often must water use data be reported to Ecology?	Annually, by January 31 st , and upon Ecology Staff Request
What volume should be reported?	Total Monthly Volume
What rate should be reported?	Monthly Peak Rate of Withdrawal (gpm)

Provisions

Relationship to Other Cockreham Island Project Water Rights

Water Rights SWC 11032, GWC 2677, G1-096365CL and GWC 1848 are all appurtenant to the project and are authorized for a combined total of 1,250 gpm, and 170 acre-feet per year for the irrigation of 743 acres within the same place of use.

Wells, Well Logs and Well Construction Standards

All wells constructed in the state must meet the construction requirements of WAC 173-160 titled "Minimum Standards for the Construction and Maintenance of Wells" and RCW 18.104 titled "Water Well Construction". Any well which is unusable, abandoned, or whose use has been permanently discontinued, or which is in such disrepair that its continued use is impractical or is an environmental, safety or public health hazard must be decommissioned.

All wells must be tagged with a Department of Ecology unique well identification number. If you have an existing well and it does not have a tag, please contact the well-drilling coordinator at the regional Department of Ecology office issuing this decision. This tag must remain attached to the well. If you are required to submit water measuring reports, reference this tag number.

Installation and maintenance of an access port as described in WAC 173-160- 291(3) is required.

Measurements, Monitoring, Metering and Reporting

An approved measuring device must be installed and maintained for each of the sources identified by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use", WAC 173-173, which describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition the Department of Ecology for modifications to some of the requirements.

Recorded water use data shall be submitted via the Internet. To set up an Internet reporting account, contact the Northwest Regional Office. If you do not have Internet access, you can still submit hard copies by contacting the Northwest Regional Office for forms to submit your water use data.

Proof of Appropriation

The water right holder must file the notice of Proof of Appropriation of water (under which the certificate of change is issued) when the permanent distribution system has been constructed and the quantity of water required by the project has been put to full beneficial use. The certificate of change will reflect the extent of the project perfected within the limitations of this authorization. Elements of a proof inspection may include, as appropriate, the source(s), system instantaneous capacity, beneficial use, annual quantity, place of use, and satisfaction of provisions.

Schedule and Inspections

Department of Ecology personnel, upon presentation of proper credentials, will have access at reasonable times, to the project location, and to inspect at reasonable times, records of water use, wells, diversions, measuring devices and associated distribution systems for compliance with water law.

Findings of Facts

Upon reviewing the investigator's report, I find all facts, relevant and material to the subject application, have been thoroughly investigated. Furthermore, I concur with the investigator on the tentative determination of the extent and validity of the water right claim; that the additional wells tap the same body of public groundwater as the original point of withdrawal; that there will be no impairment to existing rights; that the annual consumptive quantity will not be exceeded; and that there will be no detriment to the public welfare.

Therefore, I ORDER approval of Application for Change No. CG1-096365CL@1 subject to existing rights and the provisions specified above.

Your Right To Appeal

You have a right to appeal this Order to the Pollution Control Hearing Board (PCHB) within 30 days of the date of receipt of this Order. The appeal process is governed by Chapter 43.21B RCW and Chapter 371-08 WAC. "Date of receipt" is defined in RCW 43.21B.001(2).

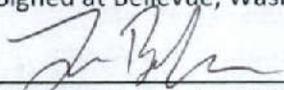

To appeal you must do the following within 30 days of the date of receipt of the Order.

File your appeal and a copy of this Order with the PCHB (see addresses below). Filing means actual receipt by the PCHB during regular business hours.

- Serve a copy of your appeal and this Order on Ecology in paper form - by mail or in person. (See addresses below.) E-mail is not accepted.
- You must also comply with other applicable requirements in Chapter 43.21B RCW and Chapter 371-08 WAC.

INVESTIGATOR'S REPORT

Applicant for Water Right Change: U.S. Golden Eagle Farms, LP
 Water Right Control Number: CG1-096365CL@1
 Investigator: Jill Van Hulle

BACKGROUND

This report serves as the written findings of fact concerning Water Right Application Number CG1-096365CL@1.

Aquilini Renewable Energy Ltd., doing business as US Golden Eagle (USGE), filed applications to change three water right certificates and one water right claim associated with its Skagit County farming operations. These applications have been processed under Ecology's Cost Reimbursement Program. Pacific Groundwater Group (PGG) prepared this report under contract to Ecology.

The stated intent of Change Application CG1-096365CL@1 is to change the place of use to enable irrigation of additional acres, change the place of use to be common to all water rights appurtenant to property owned by USGE, and add the currently used production wells to each water right document.

Legal Requirements for Proposed Change

The following is a list of requirements that must be met prior to authorizing the proposed change to G1-096365CL.

Public Notice

A public notice detailing this proposed change was published on July 11 and 18, 2015. No protests were received as a result of the statutory notice.

Consultation with the Department of Fish and Wildlife

The Department of Ecology must give notice to the Department of Fish and Wildlife (WDFW) of applications to divert, withdraw, or store water. Biologist Steven Boessow (WDFW), was notified of the proposed project and on January 15, 2016, Mr. Boessow responded that WDFW does not oppose this water right change so long as there is no increase in the amount of water withdrawn.

State Environmental Policy Act (SEPA)

A water right application is subject to a SEPA threshold determination (i.e., an evaluation whether there are likely to be significant adverse environmental impacts) if any one of the following conditions are met.

- It is a surface water right application for more than 1 cubic feet per second, unless that project is for agricultural irrigation, in which case the threshold is increased to 50 cubic feet per second, so long as that irrigation project will not receive public subsidies;
- It is a groundwater right application for more than 2,250 gpm
- It is an application that, in combination with other water right applications for the same project, collectively exceed the amounts above;
- It is a part of a larger proposal that is subject to SEPA for other reasons (e.g., the need to obtain other permits that are not exempt from SEPA);

- It is part of a series of exempt actions that, together, trigger the need to do a threshold determination, as defined under WAC 197-11-305.

None of these conditions apply to this application. While this request involves the change of four individual rights, the combined instantaneous quantity does not exceed the threshold that triggers a SEPA determination for either surface water or groundwater.

Water Resources Statutes and Case Law

RCW 90.03.380(1) states that a water right that has been put to beneficial use may be changed, including the place of use and purpose of use, if it would not result in harm or injury to other water rights. Additionally, RCW 90.44.100(2)(d) requires that when making a change in the place of use of a water right, other existing water rights shall not be impaired.

RCW 90.03.380(1) provides that “[a] change in the place of use...to enable irrigation of additional acreage...may be permitted if such change results in no increase in the annual consumptive quantity (ACQ) of water. Annual consumptive quantity means the estimated or actual annual amount of water diverted pursuant to the water right, reduced by the estimated annual amount of return flows, averaged over the two years of greatest use within the most recent five-year period of continuous beneficial use of the water right.

Changes can be made to existing water rights to the extent that the water right has been perfected and the change will not impair other water users. While changes to purpose of use can be allowed, adding additional purposes of use can only be allowed if the change will not increase the annual consumptive quantity of the water right. Water not beneficially used cannot be changed and is subject to relinquishment.

The Washington Supreme Court has held that Ecology, when processing an *Application for Change* to a water right, is required to make a tentative determination of extent and validity of the claim or water right. This is necessary to establish whether the right is eligible for change (*R.D. Merrill v. PCHB and Okanogan Wilderness League v. Town of Twisp*).

When changing or adding points of withdrawal to groundwater rights (RCW 90.44.100) the wells must draw from the *same body of public groundwater*. Indicators that wells tap the *same body of public groundwater* include:

- (a) Hydraulic connectivity
- (b) Common recharge area
- (c) Common flow regime
- (d) Geological materials that allow for storage and flow, with recognizable boundaries or effective barriers to flow.

Although the validity of a claim can only be confirmed through judicial processes called an Adjudication, Ecology can make a tentative determination of legal standing of the water right. A water right claim can represent a valid water right, and the 1969 claims law, in Ch. 90.14 RCW, recognizes that people who put water to beneficial use prior to the water code (1917 for surface water and 1945 for groundwater)

have a right to that water, and further recognizes their standing within the “first in time, first in right” code provision. The Claims Registration Act set up periods of time for water users to file their water right claims with the state. All water users relying on rights established before the water codes were adopted were advised to register a claim to a water right.

Cost Reimbursement Processing

RCW 90.03.265(2) provides that, in pursuing a cost-reimbursement project, the Department must determine the source of water from which the water is proposed to be diverted or withdrawn, including the boundaries of the area that delimit the source. The Department must determine if any other water-right applications are pending from the same source. A water source may include surface water only, groundwater only, or surface and groundwater together, if the Department finds they are hydraulically connected. The Department shall consider technical information submitted by the applicant in making its determinations under this subsection.

RCW 90.03.265(1)(b) provides that the requirement for an applicant to pay for the processing of senior applications does not apply in situations where it can be determined that the water allocated to one party will not diminish the water available to a senior applicant from the same source of supply. This request is an *Application for Change* and no water will be used beyond that which has been historically appropriated. This request will be neutral to other potential users and will not diminish the amount of water available to them, accordingly it can be processed prior to other pending applications.

INVESTIGATION

Jill Van Hulle with Pacific Groundwater Group (PGG) visited the project site on September 30, 2015. Staff from USGE and applicant John Negrin showed Ms. Van Hulle the wells and various fields.

Site Description

The project site is USGE’s farming operation on Cockreham Island, which consists of approximately 800 acres of primarily low-lying floodplain along the Skagit River, between the towns of Lyman and Hamilton in Skagit County.

The project is currently in operation with extensive plantings of blueberries. Berries are planted in elevated rows, each with a dedicated irrigation drip line. The rows are configured with enough space between them to facilitate the use of a small tractor to eliminate weed growth between the rows.

USGE has rebuilt all of the original wells, including installing sand control devices and updated fixtures. USGE’s operation is intended to be highly efficient, so the individual berry bushes are irrigated with micro-drip tape. Berries are planted approximately 2 feet apart in rows that are spaced 10 feet apart (approximately 1,750 plants per acre). The Hortau irrigation system that is used allows for the targeted use and application of water and fertilizer and is coupled with a network of sensors that monitor ambient temperature, soil-moisture tension, and humidity.

Figure 1, shows the locations of the wells and a pond used by USGE for irrigation. The fields are color-coded according to which wells are used to irrigate them.

History of Water Use

Information on the history of water use under this water right was pieced together from a variety of sources, including information provided from the applicant, irrigation guides, the site visit by PGG, aerial photos, Landsat imagery, and data reported by the Washington State Department of Agriculture (WSDA).

The Cockreham Island area has a long history of agricultural activities and was homesteaded and farmed long before the enactment of the State's modern water code in 1917.

In support of these applications, USGE provided PGG with a detailed list of agricultural activity on the island with dates as far back as 1882. This information is based primarily on the recollections of local historian Ed Lipsey. Mr. Lipsey has recently farmed portions of Cockerham Island and has firsthand knowledge of the types of crop generally produced by his neighbors. Mr. Lipsey is also the primary author of the book *Hamilton 100 Years*, which was prepared by the Hamilton Pioneer Museum in 1993 and includes references to farming activities in the area.

Over the past decades, the island has been the site of a large dairy operation, with numerous crops grown. USGE purchased the properties between 2009 and 2012, gradually converting the land from vegetable crops, such as potatoes and pasture, to blueberries.

Lipsey Claim G1-096385CL

Groundwater Claim G1-096365CL (Lipsey) corresponds to irrigation that occurred on the east half of USGE's Field 14. The claim specified that 30 acres were irrigated.

The claim was filed for the purpose of 30 acres of irrigation, within a 40-acre place of use. Aerial photos of the Lipsey property (Skagit County), dating back as far as 1937, show the land as cleared and potentially being irrigated, although the black-and-white imagery makes it difficult to determine the crop type. The east half of Field 14 presently includes 32 acres of planted berries; thus, the full 30 acres have been in production.

The property is irrigated by Field Well 14, which is a rebuild of the original "Lipsey" well that had experienced considerable deterioration due to its age. A well log is not available for the original Lipsey well; however, it is believed to have been about 40 feet deep, which is the depth of the new well. The original Qi is believed to have been fully perfected. Well logs from other wells in the area demonstrate that the alluvial aquifer is highly transmissive, and could have produced the 150 gallons per minute indicated on the claim form. Mr. Lipsey indicated that he recalled the well producing 500 gallons per minute, but given the age of the well and fact that it has been rebuilt and plumbed it is unknown if the withdrawal rate exceeded 150 gpm.

The earliest reported agricultural use on this property dates back to 1920 when the property was used by R.G. Rains to grow hay and pasture dairy cows. In 1930, the property was sold to Art Lane who continued to use the property for pasturing cows. It is not known when the original well was installed; however, it was present on the site in 1944 when it was purchased by Clarence Lipsey. Lipsey farmed it from 1944 to 1968 when he transferred it to his son Ed Lipsey, who reported to us that he has continuously used the water for irrigation of hay, potatoes, corn, and strawberries until the sale of the property to USGE at the end of the 2013 irrigation season.

Water use on the Lipsey property is represented by a *Statement of Claim*, as opposed to a Permit or Certificate, which would have been issued under the 1945 State Groundwater statutes. As such, being able to document pre-code use of the water is paramount to assessing whether the claim constitutes a valid water right.

The Lipsey claim was filed during one of the registration periods; however, the date listed as *Date of First Use* is July of 1972, which does not capture the use of water on the property prior to Ed Lipsey's ownership. The actual document was filed by Ruth Lipsey, Clarence's wife and Ed's mother. Based on our investigation of the historical use of the property, we tentatively determine that water was used on the site prior to 1945. In previous adjudication proceedings, the Courts found that the filing of a claim, even if all the information was not present, can serve to document the underlying right.

Other Water Rights Appurtenant to the Lipsey Place of Use

Ecology's records indicate that water right claims G1-096366CL and S1-079479CL are appurtenant to the same place of use as described by this filing. G1-096366CL is a long-form claim filed by Ruth Lipsey for general domestic purposes and stockwater. It is unknown if the well is the same wells as water right claim G1-096365, but it appears to represent what would be considered to be exempt uses. Ruth Lipsey indicated the date of first use as being pre-1946, which serves to further document the family's use of water on the property in the early 1940's.

Claim S1-079479CL was filed under the name of Chris Palzer for mining and domestic purposes. The place of use designated by the claim includes Sections 14, 15, 22, 23, 25, 26, 27, 28, 33, 34, 35, and 36 of Township 35 North, Range 6 East.W.M., thus the entire USGE project site is included in the Palzer place of use. The Palzer claim indicates a proposed diversion rate of 26 cfs, and 900 ac-ft/year from multiple locations on the Skagit River, Loretta Creek, Cumberland Creek and Day Creek. While the date of first use is listed as 1882, the 1974 claim does not indicate that any water is actually in use.

Water Rights Associated with the Proposed Cockreham Project

There are three other water rights related to this project when combined with this filing, allow for the potential irrigation of 250 acres. These rights are:

1. Surface Water Certificate 11032 (Mailliard) is for 0.60 cubic feet per second (cfs), 90 acre-feet per year (ac-ft/yr) for irrigation of 60 acres, with a priority date of June 22, 1967.
2. Ground Water Certificate 1848 (Philips) is for 180 gallons per minute (gpm), 100 ac-ft/yr for irrigation of 50 acres, with a priority date of May 6, 1953.
3. Ground Water Certificate 2677 (Hauenstein) is for 650 gpm, 220 ac-ft/yr for irrigation of 110 acres, with a priority date of March 31, 1954.

Applications for Change have been filed for each of these water rights. It is USGE's intent to reconfigure the use of these four water rights to meet their current water-supply needs. At the time these water rights were issued, the properties identified as the place of use were independently owned, and each

source(s) was specific to one of the rights. Today, USGE manages this as a single farm and has configured their request to identify all of the existing production wells as potential points of diversion on each of their water rights.

Although the USGE water right allows for the irrigation of 250 acres, based on a review of the individual places of use, it appears that only 220 acres have been irrigated within the limitations of the legal descriptions. Our analysis is based on USGE's field sizes, as compared to aerial photos. The remaining acreage is associated with areas that have never been irrigated, such as roadways, riparian areas, and buildings, or have not been irrigated for periods exceeding 5 years¹.

Crop Types and Irrigation Assumptions

From the distribution of crop types reported by Mr. Lipsey, as corroborated by the data provided by the Washington State Department of Agriculture, it appears that a mixture of crop types were cultivated across the project site, with potatoes and grass hay being the two most commonly reported crop types. This is true for the Lipsey property, which was used for pasture and potatoes.

Based the guidelines provided by the Washington Irrigation Guide (WIG), the amounts of supplemental irrigation needed to successfully grow potatoes and pasture grass in the Sedro Woolly area are 7.25 inches and 11.12 inches, respectively, for an average demand of 9.18 inches. Most all of the historical irrigation is reported as being conducted using "Big Gun" style sprinklers.

Table 3 presents various assumed and calculated components of the irrigation for the Lipsey water right. Based on these estimates, the 30 acres of alternating, or mixed, crops of potatoes and pasture would have required the application of 35 ac-ft/yr, of which 26.50 ac-ft/yr was consumed and 8.5 ac-ft/yr would have returned to the aquifer.

Table 3 - Annual Water Use for Irrigation of 30 Acres for Lipsey Right.

Acres	Crop Types	CIR from WIG (inches)	CIR Total (ac-ft)	App. Efficiency (%)	TIR in inch/ac (9.185 ÷ 0.65)	TIR (ac-ft)	% Total Evaporated	Total Consumed (ac-ft)	Return Flow (ac-ft)
30	Mixed potatoes and pasture	9.185	23	65	14.13	35	10 (3.5 ac-ft)	26.5	8.5

CIR – Crop Irrigation Requirement: 9.18 in equivalent to 0.76 ft

TIR – Total Irrigation Requirement = 1.18 ac-ft/irrigated-ac (equivalent to 14.13 acre-inches/irrigated acre)

ACQ – Total Consumed = 0.88 ac-ft/irrigated-ac

Table 4 presents various assumed and calculated components of the irrigation for the full 220 acres found to have been irrigated within the original places of use designated by the 4 water rights associated with this request.

¹ Since ACQ calculations must be tied to actual water use within the original place of use, de facto changes in place of use (the irrigation of areas that were not authorized by the water right) or "pre-spreading" have not been considered in this analysis.

Table 4 – Annual Water Use for Irrigation of 220 Acres

Acres	Crop Types	CIR from WIG (inches)	CIR Total (ac-ft)	App.Efficiency (%)	TIR (ac-ft)	% Total Evaporated	Total Consumed (ac-ft)	Return Flow (ac-ft)
220	Mixed potatoes and pasture	9.185	168	65	259	10	194	65

CIR – Crop Irrigation Requirement; 9.185 inches is equivalent to 0.77 feet of water

TIR – Total Irrigation Requirement = 1.18 ac-ft/irrigated-ac

ACQ – Total Consumed = 0.883 ac-ft/irrigated-ac

Based on these calculations, the irrigation of 220 acres of alternating, or mixed crops of potatoes and pasture would have required the application of 259 ac-ft/yr, of which 194 ac-ft were consumed and 65 ac-ft returned to the shallow aquifer.

Annual Consumptive Quantity Analysis

RCW 90.03.380(1) states that acreage irrigated under a water right may be enlarged if the annual consumptive quantity (ACQ) is not increased. The annual consumptive quantity means the estimated or actual annual amount of water diverted pursuant to the water right, reduced by the estimated annual amount of return flows, averaged over the two years of greatest use within the most recent five-year period of continuous beneficial use of the water right.

USGE began purchasing property on Cockreham Island in 2009 and started actively converting to blueberries in 2013, when 420 acres were planted in the fall after the traditional irrigation season. An additional 183 acres were planted the following fall, thus the composition of what was grown in the original place of use is slightly different depending on the location.

Ecology’s ACQ analysis does not allow applicants to benefit from spreading that occurred prior to the approval of the *Applications for Change*, thus the premature conversion to the irrigation of blueberries results in years where the quantity of water that was consumptively used is significantly less than it would have been when other crop types were irrigated.

Prior to 2015, the water sources were not metered. Therefore, water use has been estimated by assessing crop type and irrigation method. For the mixture of potatoes and pasture that made up most of the original crops, we have assumed a water duty of 1.18 feet per irrigated acre, which equates to a consumptive quantity of 0.883 acre-feet per irrigated acre. For blueberries, grown using USGE’s system of irrigation drip line coupled with the Hortau weather station the water duty is 0.23 acre-feet per acre.

The Lipsey property was converted to berries in the fall of 2014, thus the ACQ calculation assumes a water duty of 26.50, based on use in 2012 and 2013.

Table 5 tracks the conversion of traditional mixed crops to blueberries for the entire 220 acres based on aerial photographs, with the distinctive “texture” of the rowed berry crops making it easy to distinguish the cropping patterns.

Table 5 – ACQ Estimates by Year (Ac-Ft)

	2008	2009	2010	2011	2012	2013	2014
Acres of Blueberries	0	0	0	0	0	154	220
Acres of Row Crops/ Pasture	220	220	220	220	220	66	0
ACQ	194	194	194	194	194	92	51
Total Acreage	220	220	220	220	220	220	220

For the four water rights proposed for change, the average of the two highest of the last 5 years of continuous use is the same 194 ac-ft/yr. This is because, regardless of whether the lower water-duty berries were established in 2013 or 2014, we can use the higher water duty years of either 2009/2010 or 2010/2011.

Proposed Water Demand

USGE has determined they need 2.60 inches a year per acre to successfully grow blueberries. These water demand analysis also assumes that the irrigation system for the blueberries is working at or above a 95% efficiency rate, and a 5% evaporation rate.

In the four applications for change filed by USGE, the applicant proposed irrigation of 743 acres within the enlarged place of use.

Table 6 assesses the demand associated with 743 acres of highly efficient blueberry irrigation and it shows that a consumptive quantity of approximately 169 ac-ft/yr is needed, which is less than the 194 ac-ft/yr that was calculated based on previous cropping patterns.

Table 6 – Water Use for Irrigation of 743 Acres of Blueberries

Acres	Crop Type	CIR (in)	CIR Total (ac-ft)	App. Efficiency (%)	TIR (ac-ft)	% Total Evaporated	Total Consumed (af)	Return Flow (ac-ft)
743	Blueberries	2.60	161	95	169	5	169	0.00

CIR -Crop Irrigation Requirement: 2.6 in = 0.22 ft
 TIR = 0.227 ac-ft/irrigated-ac
 ACQ = 0.227 ac-ft/irrigated-ac

Based on the individual extents of the 4 rights, they can be spread as follows, using an ACQ factor of 0.227 (169 ac-ft/743 ac-ft):

Table 7 – New Acre Authorizations by Water Right

Water Right/Name	Original Acres Verified	Original ACQ (ac-ft/yr)	Potential Spreading (ac)
SWC 11032/Mailliard	60	53	233
GWC 2677/Hauenstein	92	81	357
GWC 1848/Philips	38	33.5	148
G1-096365CL/Lipsev	30	26.5	117
Total	220	194	855

Because USGE only needs an ACQ of 169 ac-ft/yr of the original ACQ of 194 ac-ft/yr to irrigate 743 acres, there will be a balance of 25 (194-169) ac-ft/yr. This quantity can be held by USGE, subject to relinquishment if not beneficially used for 5 or more years without sufficient cause. Or, another option may be to place this quantity in Ecology’s Trust Water Program as a permanent or temporary donation.

An ACQ “block” of 25 ac-ft/yr could result in the irrigation of an additional 112 acres (855-743). However, prior to expanding the number of acres under cultivation, Ecology would review metering data from the operation at that time to ensure that the estimated crop demand of 2.6 inches is adequate. Should USGE use more than the projected TIR of 169 acre-feet, they must notify Ecology immediately.

Table 8 – Recommended Allocation²

Water Right/Owner Name	GPM	Acres	ACQ Needed (ac-ft/yr)	ACQ remaining (ac-ft/yr)
SWC 11032/Mailliard	270	203	46	6.8
GWC 2677/Hauenstein	650	311	71	10.5
GWC 1848/Philips	180	128	29	4.3
G1-096365CL/Lipsev	150	101	23	3.4
Total	1,250	743	169	25

Hydrogeologic Evaluation

This discussion of the hydrogeological conditions of the project site are supported by the Technical Memo prepared by Pacific Groundwater entitled *Hydrogeologic and Impairment Evaluation of the US Golden Eagle Farms Water Right Change Applications*, dated March 11, 2016.

The Skagit River floodplain is a broad, relatively flat alluvial valley that is approximately 3,000 feet wide near Cockreham Island. The valley is underlain by fluvial sand and gravel, with occasional layers of clay, silt, and peat. Collectively these sediments are referred to as the Alluvial aquifer where saturated with groundwater. The alluvial floodplain is bounded to the north and south by alluvial terraces and mountains. The valley alluvium and valley walls are underlain by Jurassic age metamorphic bedrock that is mantled with glacial, landslide, and lahar sediments.

² Rounded 0.1 to allow for accounting purposes

Mapping by the U.S. Geological Survey (USGS) indicates that the alluvial aquifer can be as much as 300 feet thick in the area around Sedro Woolley (Savoca et al, 2009). The depth to groundwater in the alluvial aquifer at the project site is about 10 to 15 feet, and the aquifer extends to a depth of at least 100 feet (based on available well logs). The subject wells withdraw from this aquifer. The horizontal groundwater flow direction in the alluvial aquifer at the project site is assumed to be generally toward the Skagit River, with a small component of flow down the axis of the valley.

USGE's request will result in changes to where water is applied and where that water originates. Under the original water rights, USGE withdraws groundwater from three wells and one surface-water diversion. Under the proposed Applications for Change, USGE would cease most of its surface water diversion (8.01 acre-feet/year would be retained at the Mill Pond site) and withdrawal water from a total six existing wells with a total consumptive use of 169 acre-feet/year.

In order to assess potential changes in surface water/groundwater fluxes along the nearby Skagit River caused by the proposed additional groundwater withdrawal, PGG developed a groundwater-flow model (using the USGS's modeling program, MODFLOW) to evaluate streamflow capture under the existing and proposed water-use regimes (PGG, 2015).

The groundwater modeling indicates that the cumulative capture of surface water from the Skagit River will not increase along any reach of the river under the future water-use configuration, nor will other groundwater users be impaired.

Evaluation of Water Availability

USGE operates 6 production wells that are completed in the alluvial aquifer at depths ranging between 30 to 60 feet below ground surface. The wells are designated by the fields they supply and include Field Well 1, Field Well 4, Field Well 6, Field Well 10, Field Well 13 and Field Well 14.

Well logs were located for Field Well 1, Field Well 4, Field Well 13 and Field Well 14. Information related to water availability from these logs are provided below.

- Field Well 1 (Well Tag: BHZ526) was drilled for Knutzen Brothers Farms in 2003. The well was constructed with an 8-inch casing to a depth of 54 feet and completed with a 10-ft screen at depths of 39 to 49 feet in a zone characterized as sand and gravel. The static depth to water at time of drilling was 9.5-ft. An air-lift test was conducted at the time of drilling that demonstrated a potential well capacity of 500 gpm.
- Field Well 4 (Well Tag: AHG046) was drilled for M.G Hauenstein in June of 1953. The well was constructed with an 8-inch casing to a depth of 39 feet and is perforated from 15 to 36 feet in a zone characterized as coarse sand and gravel. Preliminary pump testing of the well at the time of drilling indicated that the well was capable of producing over 100 gallons per minute per foot of drawdown (i.e. specific capacity). The water right associated with this well allowed for withdrawals of 650 gpm. The well should be capable of sustaining this rate for at least short periods of time. At 650 gpm, the drawdown in the well would be about 6.5 feet (assuming no significant reductions in well efficiency or aquifer transmissivity with increased pumping rates). Given a static depth to water of 11.5 feet (at time of drilling), the total depth to water when operating at 650 gpm would be 18 feet, which would leave about 85% of the well's perforations submerged.

- Field Well 10 (Well Tag: BHZ524) was constructed for Don Kaaland in 2007. The well is 45 feet deep and screened between depths of 25 to 40 feet in a zone characterized as coarse sand and gravel. An air-lift test that was conducted at the time of drilling demonstrated a potential well capacity of 300 gpm.
- Field Well 13 (Well Tag: APS882) was constructed for C.G. Philips in September of 1953. The well was constructed with an 8-inch casing to a depth of 30 feet and is perforated between depths of 16 to 30 feet in a zone characterized as coarse river gravel. The water right associated with this well allowed for withdrawals of 180 gpm. Given the well's completion in "coarse river gravel", the well could have easily produced this rate.
- Field Well 14 (Well Tag: BHE534) was constructed for USGE as a replacement for the original "Lipsey" well. It is 56 feet deep, and screened between 28.5 and 38.5 feet in a zone characterized as sand and gravel. The static water level depth at time of drilling was 14 feet. An air-lift test that was conducted at the time of drilling demonstrated a potential well capacity of 600 gpm.

All of USGE wells in the Cockereham Island area are completed in highly productive sand and gravel zones within the upper portion of the alluvial aquifer, they are expected to produce several hundred gallons per minute (depending on the size of individual pumps), they are hydraulically connected and share a common recharge area and flow regime. They are therefore considered to be in the same-body of public groundwater.

Impairment Considerations

The proposed changes involve both surface-water and groundwater rights. Therefore, impairment of both minimum instream flow water rights and other groundwater rights must be considered.

Impairment of Minimum Instream Flow Water Rights

The term "instream flow" is used to identify a specific stream flow (typically measured in cubic feet per second, or cfs) at a specific location for a defined time, and typically following seasonal variations. Instream flows are usually defined as the stream flows needed to protect and preserve instream resources and values, such as fish, wildlife and recreation.

Once established, a minimum flow constitutes an appropriation with a priority date as of the effective date of the rule establishing the minimum flow (RCW 90.03.345). Thus, a minimum flow set by rule is an existing right which may not be impaired (RCW 90.03.345; RCW 90.44.030).

The Skagit River Basin Instream Resources Protection Program Rule (WAC 173-503) established instream flows in the basin. Because the proposed changes will not result in the withdrawal of additional water from the basin, the approval of this request will not adversely impact instream flows.

Impairment, Qualifying Ground Water Withdrawal Facilities, and Well Interference

There are three concepts that are important when considering whether a withdrawal of water from a well would impair another existing water right. The concepts are defined as follows:

1. Impairment is an adverse impact on the physical availability of water for a beneficial use that is entitled to protection (i.e., water rights that are both senior and junior in priority to the right the applicant seeks to change).

2. Qualifying ground water withdrawal facilities are defined as those wells which in the opinion of the Department are adequately constructed. An adequately constructed well is one that (a) is constructed in compliance with well construction requirements; (b) fully penetrates the saturated thickness of an aquifer or withdraws water from a reasonable and feasible pumping lift (WAC 173-150); (c) the withdrawal facilities must be able to accommodate a reasonable variation in seasonal pumping water levels; and (d) the withdrawal facilities including pumping facilities must be properly sized to the ability of the aquifer to produce water.
3. Well interference may occur when several wells penetrate and withdraw ground water from the same aquifer. Each pumping well creates a drawdown cone. When several wells pump from the same aquifer, well density, aquifer characteristics, and pumping demand may result in individual drawdown cones that intersect and form a composite drawdown cone. At any point in an aquifer, the composite drawdown caused by pumping wells will be greatly influenced by the transmissivity (T) of the aquifer. In aquifers with high Ts, composite drawdown will generally be much less than in aquifers with similar properties but with low Ts. Transmissivity is related to hydraulic conductivity (K) and the saturated thickness (b) of an aquifer by the relationship $T=Kb$.

An aquifer's hydraulic conductivity (K) is derived from the physical properties of both the fluid and geologic materials that form an aquifer. Once formed, an aquifer's saturated thickness (b) becomes important in evaluating its transmissivity. For regions of similar K in an aquifer, a large saturated thickness will result in a much higher T than a small saturated thickness. As a result, regions of similar K in an aquifer with a large saturated thickness will experience less composite drawdown or well interference than with a small saturated thickness.

Some conditions, however, will increase or steepen composite drawdown in an aquifer. For instance, where characteristics (such as very fine, clay-rich, or poorly sorted sediments) of an unconfined aquifer cause significant drawdown relative to the saturated thickness, the composite drawdown will increase as saturated thickness is reduced and T becomes smaller. Additionally, in regions where negative or no-flow boundaries occur, such as near the edges of a valley fill aquifer where it is bounded by bedrock, composite drawdown will be steeper than in the central part (generally the greatest thickness region) of the aquifer. Consequently, it is commonly understood that the greatest composite drawdown or well interference is more likely to occur in regions of low transmissivities, thin saturated thicknesses and near negative or no-flow boundaries than in regions of high transmissivities, large saturated thicknesses, and away from negative or no-flow boundaries.

USGE's requested change to these rights will result in both a larger place of use and the ability to irrigate more acres. This can only be allowed if it can be accomplished without impairment to other water users or instream flows.

Based on our assessment of the ramifications of shifting points of withdrawal, other water users will not be affected because the amount of water used by USGE will not increase and the shift will not result in any significant interference impact to existing groundwater users.

A review of water right records on file with the Department of Ecology for the four sections that include Cockreham Island indicates that there are no other conflicting water uses that would be impacted by the proposed changes to USGE's operations. Of the 51 documents on file, we note that 42 are claims and likely represent small, single domestic uses. The others are certificates for small scale irrigation.

Public Interest Considerations

Developing new sources of supply in the Skagit River watershed is challenging, and Ecology generally promotes, to the extent possible, the use of existing water rights to support new development. The USGE property has historically been irrigated, and with the advent of conservation based application methods, more acreage can be irrigated without adverse impacts.

This water right change will not be detrimental to the public interest.

Consideration of Protests and Comments

No protests were received as a result of the public notice.

CONCLUSIONS

The subject water right is eligible for change, the additional wells will tap the same body of public groundwater as the original well; there will be no impairment of existing rights; the combined total withdrawal from the original and the additional wells will not increase the instantaneous or annual quantity of this right; and there will be no detriment to the public interest.

RECOMMENDATIONS

Based on the above investigation and conclusions, I recommend that this request be approved in the amounts and within the limitations listed below and subject to the provisions listed above.

Purpose of Use and Authorized Quantities

The amount of water recommended is a maximum limit and the water user may only use that amount of water within the specified limit that is reasonable and beneficial:

- 150 gpm
- 26.5 ac-ft/yr (3.5 acre-feet would be available Trust donation)
- Irrigation of 101.32 acres

Points of Withdrawal

Well	TWN	RNG	SEC	QQ Q
Well 1	35	6E	22	SE ¼ NW ¼
Well 4	35	6E	22	SE ¼ NE ¼
Well 6	35	6E	16	SE ¼ SW ¼
Well 10	35	6E	16	NW ¼ SE ¼
Well 13	35	6E	16	NE ¼ NE ¼
Well 14	35	6E	15	SE ¼ NW ¼

Place of Use

As described on Page 2 of this Report of Examination, Attachment 1 shows the place of use for USGE's Cockreham Island operation.
