

State of Washington
**REPORT OF EXAMINATION
 FOR WATER RIGHT APPLICATION
 G1-28764**

File No. G1-28764
 WAC Doc ID: 6006349

PRIORITY DATE
 November 12, 2013

APPLICATION NUMBER
 G1-28764

MAILING ADDRESS

Zachary and Adele Barborinas
 15119 Mclean Road
 Mount Vernon, WA 98273

SITE ADDRESS (IF DIFFERENT)
 31827 19th Dr. NW
 Stanwood, WA 98292

Quantity Authorized for Withdrawal or Diversion

DIVERSION RATE	UNITS	ANNUAL QUANTITY (AF/YR)
10	GPM	0.39

Purpose

PURPOSE	WITHDRAWAL OR DIVERSION RATE			ANNUAL QUANTITY (AF/YR)		PERIOD OF USE (mm/dd)
	ADDITIVE	NON-ADDITIVE	UNITS	ADDITIVE	NON-ADDITIVE	
Single Domestic Use	10		GPM	0.39		Continuous

Source Location

WATERBODY	TRIBUTARY TO	COUNTY	WATER RESOURCE INVENTORY AREA
Well		Snohomish	07

SOURCE FACILITY/DEVICE	PARCEL	TWN	RNG	SEC	QQ Q	LATITUDE	LONGITUDE
Well (Well Tag # BAT124)	01075700000400	32N	04E	2	SE	48.282557N	-122.253992W

Datum: WGS84

Place of Use (See Map, Attachment 1)

PARCEL

01075700000400 (Lot 4 of Sun Peak Estates)

LEGAL DESCRIPTION OF AUTHORIZED PLACE OF USE

Parcel 01075700000400 (Lot 4 of Sun Peak Estates) located in Section 2, Township 32N, Range 4E, SE Quarter in Snohomish County.

(see **Attachment 2** for a full legal description)

Proposed Works

The system will consist of a well and water distribution system to one home.

Development Schedule

BEGIN PROJECT	COMPLETE PROJECT	PUT WATER TO FULL USE
Started	December 31, 2023	December 31, 2028

Measurement of Water Use

How often must water use be measured?	Monthly
How often must water use data be reported to the Department of Ecology (Ecology)?	Monthly during the first two years of water use, then Annually
What volume should be reported?	Total Annual Volume and each monthly volume
What rate should be reported?	Annual Peak Rate of Withdrawal (gpm)

Provisions

You have demonstrated to Ecology's satisfaction that when your proposed mitigation plan, as conditioned below, is implemented, the proposed withdrawal and use of groundwater from the well on your property will not impair senior water rights, including instream flow rights, or be detrimental to the public interest or welfare. Accordingly, Ecology **approves** the mitigation plan insofar as it relates to the well on your property, as documented in Exhibits B and C to Sundberg Homes, Inc., et al. *Request/Petition for Declaratory Order or alternatively, Approval of Mitigation Plan*, dated November 9, 2012, subject to the following conditions:

1. As the proponent of the mitigation plan insofar as it relates to the well on your property, you are responsible for the ongoing commitments of its implementation as long as you own the property. In the event that the property is sold or transferred, all obligations of this mitigation plan are binding on your successors in interest.

2. Your average water use shall not exceed 350 gallons of water per day in any month.
3. You may not use water from the well on your property to water a lawn or garden or for any similar outdoor use, including any other consumptive use, *provided* that you may use such water outside to wash a car or other vehicle, to wash a dog or other pet that lives in the house, or for other minor, non-consumptive uses of like kind. Except as otherwise provided in this paragraph, the well on your property must only supply the indoor plumbing system. Connection to the outdoor plumbing system, such as exterior faucets or hose bibs, by the well on your property is prohibited, except for a single faucet or hose bib within 25 feet of a driveway or garage entrance. The prohibition on connection to outdoor plumbing in this paragraph shall remain applicable unless and until another lawful approval is obtained for the withdrawal and use of water from the well on your property that allows you to use water from the well for outdoor watering and to connect the well to outdoor plumbing. This condition does not prohibit the use of stand-alone cisterns, rain barrels, or other rainwater catchment systems for outdoor water use or other consumptive use so long as they are solely supplied by captured rooftop rainwater or water that is trucked in from off-site, you provide at least 30 days advance written notice to Ecology of your intent to use such water before commencing such use, including a description of the type and design of the system you intend to use, and you obtain such approvals, if any, as may be legally required for such use. Ecology may monitor your compliance with the provisions in this paragraph through lawful on-site visits and aerial photography, and will investigate reports of non-compliance by third parties. You will provide Ecology with permission to enter Sun Peaks Estates for such purposes.
4. All water use shall be measured with a meter at the wellhead that meets the requirements of WAC 173-173-090 and WAC 173-173-100. The meter shall be installed, operated, and maintained in accordance with WAC 173-173-110 and WAC 173-173-120. During the first two years of water use, you shall deliver monthly water use reports to Ecology by the 15th day of the following month. After the first two years of water use, you shall deliver monthly water use reports to Ecology annually on October 31st of each year (for the period from October 1 of the preceding year through September 30 of the current year). If the property is sold or transferred, the new owner shall provide monthly water use reports to Ecology by the 15th day of the following month during the first two years of water use and thereafter shall deliver monthly water use reports to Ecology annually on October 31st of each year (for the period from October 1 of the preceding year through September 30 of the current year). If monthly or annual water use reporting demonstrates a potential violation of condition number 2 above and water use is not required to cease under condition numbers 8 or 9 below, Ecology shall require monthly reporting until it appears that water use has complied with condition number 2 above for at least 24 consecutive months. Compliance with this provision is subject to inspection by Ecology through lawful on-site visits.

5. Your on-site sewage disposal system shall be inspected at a frequency outlined in WAC 246-272A-0270. Copies of the inspection reports shall be provided to Ecology. You will provide Ecology with permission to enter Sun Peaks Estates for such purposes.
6. Your sewage disposal shall remain through on-site sewage disposal. If sewage from your property is exported through a sanitary sewer system, the use of water from your well shall cease until an alternative source of mitigation water is found and approved by Ecology.
7. Notice of the Sundberg Homes, Inc, et al. Request for Approval of Mitigation Plan shall be incorporated in your property title by recording this Report of Examination in the Snohomish County Auditor's Office. The notice shall include a copy of the Sundberg Homes, Inc, et al. Request for Approval of Mitigation Plan and this Report of Examination.
8. Non-compliance with any of these conditions may result in penalties or an administrative order to cease using water per RCW 90.03.600 and 90.03.605.
9. Pursuant to WAC 173-503-060(c), if monitoring of this mitigation plan shows the mitigation is not effective, Ecology approval of the mitigation plan shall be suspended and water use shall cease until Ecology approves a new or revised mitigation plan.

The mitigation plan approved for your permit, through this Report of Examination, authorizes only the withdrawal and use of water from the well located on your property, and, except as otherwise provided in condition 3 above, the mitigation plan conditions set forth in this letter apply only to the withdrawal and use of water from that well. All of the mitigation plan conditions set forth in this report shall remain applicable to the withdrawal and use of water from the well located on your property notwithstanding any sale or other transfer or conveyance of the property, unless and until another lawful approval is obtained for the withdrawal and use of water from that well.

Water Use Efficiency

The water right holder is required to maintain efficient water delivery systems and use of up-to-date water conservation practices consistent with RCW 90.03.005.

Proof of Appropriation

The water right holder shall file the notice of Proof of Appropriation of water (under which the certificate of water right is issued) when the permanent distribution system has been constructed and the quantity of water required by the project has been put to full beneficial use. The certificate will reflect the extent of the project perfected within the limitations of the permit. Elements of a proof inspection may include, as appropriate, the source(s), system instantaneous capacity, beneficial use(s), annual quantity, place of use, and satisfaction of provisions.

Schedule and Inspections

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the project location, and to inspect at reasonable times, records of water use, wells, diversions, measuring devices and associated distribution systems for compliance with water law.

Findings of Facts

Upon reviewing the investigator's report, I find all facts, relevant and material to the subject application, have been thoroughly investigated.

Furthermore, I concur with the investigator and find that: water is available from the source in question; that there will be no impairment of existing rights; that the purpose(s) of use are beneficial; and that there will be no detriment to the public interest or welfare.

Therefore, I ORDER approval of Application No. G1-28764, subject to existing rights and the provisions specified above.

Further, I ORDER that at the time a permit is issued to you under this approval, such permit shall supersede the Department of Ecology's May 1, 2013, letter to you approving your mitigation plan as documented in Exhibits B and C to Sundberg Homes, Inc., et al. *Request/Petition for Declaratory Order or alternatively, Approval of Mitigation Plan*, dated November 9, 2012, and the Department of Ecology's May 1, 2013, letter to you shall be rescinded.

Your Right To Appeal

You have a right to appeal this Order to the Pollution Control Hearing Board (PCHB) within 30 days of the date of receipt of this Order. The appeal process is governed by Chapter 43.21B RCW and Chapter 371-08 WAC. "Date of receipt" is defined in RCW 43.21B.001(2).

To appeal you must do the following within 30 days of the date of receipt of the Order.

- File your appeal and a copy of this Order with the PCHB (see addresses below). Filing means actual receipt by the PCHB during regular business hours.
- Serve a copy of your appeal and this Order on Ecology in paper form - by mail or in person. (See addresses below.) E-mail is not accepted.

You must also comply with other applicable requirements in Chapter 43.21B RCW and Chapter 371-08 WAC.

Investigator's Report
 Application for Water Right – Zachary and Adele Barborinas
 Water Right Control Number: G1-28764
 Investigator: Jerry Liszak

BACKGROUND

The applicant's property is located in the Carpenter-Fisher sub-basin within the Lower Skagit Watershed, also known as Water Resource Inventory Area 3 (WRIA 3). WRIA 3 has an Instream Resources Protection Program rule (WAC 173-503) established in 2001 to protect senior water rights, maintain a healthy ecosystem, and provide limited amounts of water for future uses. Sun Peak Estates (Sun Peak) submitted proposed mitigation plans on behalf of seven landowners, including the applicant, which Washington Department of Ecology (Ecology) modified by allowing for 1/12th acre lawn irrigation on each lot while accounting for septic return flow of water into the Fisher basin with water pumped from wells tapping water from an aquifer connected to the adjacent Stillaguamish basin. On May 1, 2013, Ecology approved the mitigation plan and issued seven approval orders to the affected parties owning lots within Sun Peak Estates, including the applicant, with certain conditions, including requiring all the wells to be completed in the deeper Sedimentary Aquifer. The Swinomish Indian Tribal Community (Tribe) appealed Ecology's approvals of the mitigation plans on May 28, 2013.

Subsequent to filing the appeal, the seven Sun Peak lot owners (including the applicant), the Tribe, and Ecology have negotiated a settlement resulting in a mitigation agreement by the parties. The mitigation agreement is implemented through the provisions to this water right set forth on pages 2 through 4 above.

To carry out the settlement, Ecology received a letter from the applicant on November 12, 2013, requesting Ecology to consider the proposed mitigation plan submitted by Sun Peak as an application for a water right permit. Ecology finds that the information in the proposed mitigation plan is sufficient to enable Ecology to consider it as a water right permit application under RCW 90.03.250. Further, Ecology finds that the proposed mitigation plan constitutes a proposed "resource management technique" that is designed to "[offset] the impact of the withdrawal of water proposed in the application for the water right . . . in the same water resource inventory area" under RCW 90.44.055.

Project Description

The applicant intends to withdraw groundwater from a well on its property for single domestic use. The system will consist of a well and water distribution system to the home.

Table 1
 Summary of Application No. G1-28764

<i>Attributes</i>	<i>Proposed</i>
Applicant	Zachary and Adele Barborinas

Application Received	November 12, 2013
Instantaneous Quantity	10 gpm
Source	Well (Well Tag # BAT124)
Point of Withdrawal	SE ¼, Section 2, Township 32 North, Range 4 East, W.M.
Purpose of Use	Single Domestic
Period of Use	Continuous
Place of Use	The southeast quarter of Section 2, Township 32 North, Range 4 East of the Willamette Meridian. Located in Snohomish County, Parcel 01075700000400 (Lot 4 of Sun Peak Estates)

Legal Requirements for Application Processing

The following requirements must be met prior to processing a water right application:

- **Public Notice**

Notice of this application was published in the Everett Daily Herald on December 7, 2013, and December 14, 2013. No protests were received.

- **State Environmental Policy Act (SEPA)**

A water right application is subject to a SEPA threshold determination (i.e., an evaluation whether there are likely to be significant adverse environmental impacts) if any one of the following conditions are met:

- (a) It is a surface water right application for more than 1 cubic feet per second, unless that project is for agricultural irrigation, in which case the threshold is increased to 50 cubic feet per second, so long as that irrigation project will not receive public subsidies;
- (b) It is a groundwater right application for more than 2,250 gallons per minute;
- (c) It is an application that, in combination with other water right applications for the same project, collectively exceed the amounts above;
- (d) It is a part of a larger proposal that is subject to SEPA for other reasons (e.g., the need to obtain other permits that are not exempt from SEPA);
- (e) It is part of a series of exempt actions that, together, trigger the need to do a threshold determination, as defined under WAC 197-11-305.

The requested water right is part of the Sun Peaks development on a 40-acre parcel comprised of 12 residential lots having individual wells for each home. Because the combined pumping of all

the wells does not meet any of these conditions, it is categorically exempt from SEPA and a threshold determination is not required.

INVESTIGATION

Site Visit/Site Description

On August 3, 2012, John Rose, of Ecology, and Chuck Lindsay, Associated Earth Sciences, Inc., verified the well location, diameter, and Well Tag Number (BAT124). Depth to water measured from the top of the access port was 165.58 feet. Based on a LIDAR surface elevation of 670.68 feet and accounting for a 1.83 foot casing stickup, the static groundwater elevation was 506.93 feet.

Other Rights Appurtenant to the Place of Use

There are no existing water rights appurtenant to the proposed place of use.

Hydrogeology

The ground surface at Sun Peak and the immediate surrounding area is covered by a layer of low permeability glacial till sediments that are underlain at a relatively shallow depth by Chuckanut Formation bedrock. The glacial till sediments are a few tens of feet thick in the vicinity of the site and consist of varying amounts of clay, silt, sand, gravel, cobbles, and boulders. The glacial till is dense, has low permeability, and is considered to act as a confining unit. The Chuckanut Formation consists of alternating intervals of coarse grained sandstone and minor conglomerate and fine grained sandstone and siltstone. Fractured portions of the Chuckanut Formation are referred to as the Sedimentary Aquifer by the USGS (2009). The Sedimentary Aquifer underlies the Sun Peak properties. The aquifer is confined under Sun Peak site and in other areas where it is fully saturated and covered by glacial sediments. It is unconfined in other areas where it crops out. There are also fine grained bedrock intervals within the Sedimentary Aquifer which may produce localized confining conditions. See Attachment 3, *Hydrogeologic Assessment Sun Peaks Estates, Snohomish County*, prepared by Associated Earth Sciences, Inc, dated October 30, 2012.

Well log data indicate regional groundwater flow directions in the Sedimentary Aquifer is generally westerly trending beneath the Sun Peak site, although it is relatively flat and has northern and southern gradient components respectively north and south of the site. Well logs at different completion elevations also suggest there is a downward gradient component. The Sun Peak wells will tap ground water in the Sedimentary Aquifer at an elevation of roughly 500 feet.

Well Drilling

The 12 domestic wells drilled at Sun Peak range in depth from 42 feet to 425 feet and are completed within fractured, water-bearing sedimentary bedrock. The wells all appear to have encountered roughly 25 feet (Lot 11) to 80 feet (Lot 9) of relatively dense, low permeability glacial till overlying sedimentary bedrock. Nine of the onsite wells (Lots 3, 4, 5, 6, 7, 8, 9, 11, and 12) appear to intercept water bearing, fractured sandstone in the Sedimentary Aquifer at depths of greater than 140 feet below the ground surface.

The depths to ground water in eight of the wells ranged between approximately 145 feet (Lot 3) and 177 feet (Lot 12), which correspond to a rough elevation range of 502 feet to 517 feet. The wells on three lots (Lots 1, 2, and 10) appear to intercept localized shallow water-bearing fractures in the upper bedrock unit that begin at depths of roughly 40 to 60 feet. The depth to ground water measured in the shallow wells in August, 2012, ranged from less than 10 feet (Lot 2) to approximately 20 feet (Lot 10), which correspond to a range in elevation from roughly 641 feet to 622 feet. The shallow wells on lots 2 and 10 must be deepened to intercept water from the regional Sedimentary Aquifer at an elevation below 500 feet as a provision for obtaining a water right permit for those lots.

Yields from the onsite wells, as reported by the well drillers on the water well reports, range from approximately 1.5 gallons per minute (gpm) to 35 gpm. However most of these were determined from bailer tests which are not as accurate as pump tests. Yields from the wells completed in the deeper Sedimentary Aquifer are reported as an average of approximately 11 gpm.

Site Hydrogeology

Ecology reviewed the Sun Peaks Estates Mitigation Plan and Sun Peaks Hydrogeologic Assessment with all relevant hydrogeologic data and reports, including comments and information submitted by the Swinomish Indian Tribal Community. While Ecology agrees with the general concept of the mitigation plan, Ecology is modifying some assumptions in the Sun Peaks Estates mitigation plan to factor in information regarding the United States Geologic Survey (USGS) Groundwater Model, water well logs and other geologic reports. Ecology's analysis included information received from the Tribe and its reference to USGS model estimates of groundwater extraction and recharge percentage effects on the Fisher Creek Basin. This analysis indicates that if the wells on lots 2 and 10 of Sun Peak Estates are deepened to intercept the regional Sedimentary Aquifer, if outdoor water use from the wells is prohibited on the Sun Peak Estates lots as described in the provisions above, and if the other conditions set forth in the provisions above are satisfied, return flow from septic systems at the Sun Peaks lots to the Fisher Creek Basin would mitigate the use and withdrawals' groundwater extraction effects on the Fisher Creek Basin. These findings of fact apply to the applicant's proposed use and withdrawal of water.

Four Statutory Tests

This Report of Examination (ROE) evaluates the application based on the information presented above. To approve the application, Ecology must issue written findings of fact and determine that each of the following four requirements of RCW 90.03.290 has been satisfied:

1. The proposed appropriation would be put to a beneficial use;
2. Water is available for appropriation;
3. The proposed appropriation would not impair existing water rights; and
4. The proposed appropriation would not be detrimental to the public welfare.

Beneficial Use

The Water Resources Act of 1971 (RCW 90.54.020(1)) defines beneficial uses of water. The application requests water for single domestic use. Single domestic use is explicitly listed as a beneficial use under RCW 90.54.020(1); therefore, the proposed use of water is a beneficial use.

Availability

For water to be available for appropriation, it must be both physically and legally available.

Physical Availability

For water to be physically available for appropriation there must be ground or surface water present in quantities and quality and on a sufficiently frequent basis to provide a reasonably reliable source for the requested beneficial use or uses. In addition, the following factors are considered:

- Volume of water represented by senior water rights, including federal or tribal reserved rights or claims;
- Water right claims registered under Chapter 90.14 RCW;
- Groundwater uses established in accordance with Chapter 90.44 RCW, including those that are exempt from the requirement to obtain a permit; and
- Potential riparian water rights, including non-diversionary stock water.
- Lack of data indicating water usage can also be a consideration in determining water availability, if the department cannot ascertain the extent to which existing rights are consistently utilized and cannot affirmatively find that water is available for further appropriation.

The bailer testing performed on the proposed point of withdrawal showed that water is available from the applicants well completed within the Sedimentary Aquifer.

Legal Availability

To determine whether water to be legally available for appropriation, the following factors are considered:

- Regional water management plans – which may specifically close certain water bodies to further appropriation.
- Existing rights – which may already appropriate physically available water.
- Fisheries and other instream uses (e.g., recreation and navigation). Instream needs, including instream and base flows set by regulation. Water is not available for out of stream uses where further reducing the flow level of surface water would be detrimental to existing fishery resources.
- Ecology may deny an application for a new appropriation in a drainage where adjudicated rights exceed the average low flow supply, even if the prior rights are not presently being exercised. Water would not become available for appropriation until existing rights are relinquished for non-use by state proceedings.

Water in the Fisher Creek sub-basin is not legally available for new consumptive uses in the absence of approved mitigation measures. However, given that water will be added to the Fisher Creek sub-basin under the conditions of the mitigation plan, as modified by Ecology and agreed to by the Tribe and the applicant, there will be a net benefit to the Fisher Creek sub-basin. A significant proportion of the water will come from the Stillaguamish Basin which will be delivered into the Fisher Creek sub-basin via septic recharge. Water Resource Inventory Area (WRIA) 5 – Stillaguamish River basin has a reservation system for permit-exempt domestic wells (WAC 173-505-090) which accounts for water use at a rate of 350 gallons per day (gpd) and limits outdoor water use to the watering of 1/12 acre for domestic exempt wells. Reservation water is still available in the Stillaguamish River basin. The 350 gpd can be reduced to 175 gpd if the residence is served by an on-site septic system located within the same WRIA. However, in this situation the water will be transported into the adjacent WRIA. Therefore, the Stillaguamish domestic reservation shall be debited 350 gpd on approval of this water right. The maximum potential negative impact to groundwater/surface water in the Stillaguamish Basin is 350 gpd per well, which is equal to a maximum annual total of 0.39 acre-feet per year (ac-ft/yr). See Attachment 4, *Hydrogeologic Assessment and Mitigation Plan Sun Peaks Estates, Snohomish County*, prepared by Associated Earth Sciences, Inc., dated October 30, 2012.

Potential for Impairment

Impairment is an adverse impact on the physical availability of water for a beneficial use that is entitled to protection. A water right application may not be approved if it would:

- Interrupt or interfere with the availability of water to an adequately constructed groundwater withdrawal facility of an existing right. An adequately constructed groundwater withdrawal facility is one that (a) is constructed in compliance with well construction requirements and (b) fully penetrates the saturated zone of an aquifer or withdraws water from a reasonable and feasible pumping lift.
- Interrupt or interfere with the availability of water at the authorized point of diversion of a surface water right. A surface water right conditioned with instream flows may be impaired if a proposed use or change would cause the flow of the stream to fall to or below the instream flow more frequently or for a longer duration than was previously the case.
- Interrupt or interfere with the flow of water allocated by rule, water rights, or court decree to instream flows.
- Degrade the water quality of the source to the point that the water is unsuitable for beneficial use by existing users (e.g., via sea water intrusion).

This applicant's well is completed in the Sedimentary Aquifer and will withdraw water hydraulically connected to both the Stillaguamish Basin and the Fisher sub-basin. This will provide more groundwater recharge to the Fisher Creek sub-basin than withdrawn from it by virtue of septic return flows mentioned above as long as the applicant and the applicant's successors-in-interest comply with Ecology's modifications of the applicant's mitigation plan as

set forth in the provisions above and as agreed to by the Tribe and the applicant. This will ensure non-impairment of instream flows in the Skagit Basin.

RCW 90.44.055 provides for water resource management techniques to increase water supply via recharge of groundwater as a means of making water available or otherwise offsetting the impact of a withdrawal of groundwater proposed in an application for water right. The increase of groundwater recharge in the Fisher Creek sub-basin will ensure that there is no reduction in water flowing from the Fisher sub-basin into the Skagit Basin. There will also be no impairment in the Stillaguamish Basin since water will be debited 350 gpd from the Stillaguamish domestic reservation, as discussed above.

Public Welfare

There will be no detriment to the public interest or welfare, because water from the Stillaguamish Basin domestic reservation will be tapped and debited, and septic recharge in the Fisher Creek sub-basin will ensure that flows will not be reduced in the Skagit Basin. This will ensure that there will be no negative impacts on the public interest and welfare including instream values, and fish populations.

Consideration of Protests and Comments

In response to public notice of this application, the Department of Ecology received no protests regarding this application for groundwater.

CONCLUSIONS

The conclusions based on the above investigation are as follows:

1. The proposed appropriation for single domestic use is a beneficial use of water;
2. The requested 10 gpm and 0.39 acre-feet per year is available for appropriation;
3. The new appropriation will not impair senior water rights; and
4. The new appropriation will not be detrimental to the public welfare.

RECOMMENDATION

Based on the information presented above, the authors recommend that the request to appropriate groundwater be approved in the amounts described, limited, and provisioned on page 2 through 4 of this report.

Subject: **FINAL REPORT**
Hydrogeologic Assessment and Mitigation Plan
Sun Peaks Estates
Snohomish County, Washington

INTRODUCTION AND BACKGROUND

This report summarizes the results of a hydrogeologic assessment completed by Associated Earth Sciences, Inc. (AESI) in support of a mitigation plan for selected lots in the Sun Peaks Estates, which is situated in the Fisher Creek subbasin of Skagit/Snohomish Counties. The general location of the Sun Peaks Estates is shown on the "Location Map," Figure 1. The layout of the site is shown on the Plat Map, Figure 2.

Sun Peaks Estates is roughly 40-acres of property that includes 12 residential lots located just north of 316th Street NW and approximately 1,300 feet east of English Grade Road in northwest Snohomish County. The ground surface of the property generally slopes downward to the southwest and ranges in elevation between roughly 600 feet and 680 feet above mean sea level. A small seasonal tributary to Fisher Creek bisects the site in an approximate east-west direction (Figure 2). All elevations referenced in this report are relative to mean sea level (datum NAVD88) unless otherwise noted.

The Sun Peaks Estates is comprised of 12 residential lots (Figure 2). However, a single home has been built on Lots 5 and 6; therefore, there are a total of 11 buildable lots at the site. Individual single-family domestic wells have been drilled on each of the original residential lots. There are currently occupied homes located on Lot 1, Lots 5/6, Lot 8, and Lot 12.

The Fisher-Carpenter Creek subbasins were closed in 2010 to the drilling of single-family domestic wells under the Skagit Instream Flow Rule amendments reservation system adopted by

the Washington State Department of Ecology (Ecology) in 2006, unless the well's potential impact to surface water flow in either Fisher Creek or Carpenter Creek is mitigated. The 2006 Skagit Instream Flow Rule amendments reservation system established the maximum total daily individual residential water use at 350 gallons per day (gpd) with outdoor water use being limited to the watering of an outdoor area not to exceed a total of ½acre. Of the 350 gpd total residential use, 175 gpd is assumed to be septic return flow, and the remaining 175 gpd is consumptive use.

Due to the closure of the Fisher Creek subbasin, the owners of seven of the Sun Peaks Estates lots (Lots 2, 3, 4, 7, 9, 10, and 11, Figure 2) are currently being denied the use of their wells for single-family residential purposes (domestic exempt) by Ecology under the assumption the wells intercept ground water that provides recharge to Fisher Creek and that their use results in a negative impact to and a diminishment of flow in the stream. These seven property owners are currently appellants (referred to herein as "appellants") in an appeal before the Pollution Control Hearings Board over the closure of the subbasin, and other related issues. The remaining wells on Lots 1, 5, 6, 8, and 12 were installed and put to beneficial use prior to 2010 and are not subject to the current subbasin closure.

The purpose of our services was to evaluate the hydrogeology of the Sun Peaks Estates area, evaluate potential impacts to source water, and to ascertain if the use of the appellants' wells will result in a negative impact to or a diminishment of a source or flow in Fisher Creek or if mitigation is an option.

GEOLOGIC AND HYDROGEOLOGIC SETTING

General

The U.S. Geological Survey (USGS) recently completed a comprehensive and detailed geologic/hydrogeologic evaluation of the lower Skagit River basin, including the Fisher and Carpenter Creek subbasins, for the Skagit County Public Works Department (Skagit County), Skagit County Public Utility District No. 1 (District), and Ecology. Details of the USGS study are presented in Scientific Investigations Report (SIR) 2009-5270 titled *Hydrogeologic Framework, Groundwater Movement, and Water Budget in Tributary Subbasins and Vicinity, Lower Skagit River Basin, Skagit and Snohomish Counties, Washington*. The USGS also developed a detailed numerical ground water flow model of a large portion of the lower Skagit River drainage, including Carpenter and Fisher Creek subbasins. Details of the USGS ground water flow model are presented in SIR 2010-5184 titled *Numerical Simulation of the Groundwater-Flow System in Tributary Subbasins and Vicinity, Lower Skagit River Basin, Skagit and Snohomish Counties, Washington*.

The following is a summary of the regional geologic/hydrogeologic setting of the area in the immediate vicinity of the Sun Peaks Estates, as presented in the above-referenced USGS reports. Pertinent geologic and hydrogeologic details of the area in the vicinity of the Sun Peaks Estates, including contours of ground water elevations in the bedrock aquifer that underlies the project site, are also shown on Figure 1. A generalized geologic cross section of the Sun Peaks Estates site, based on subsurface conditions presented on water well reports for the on-site wells and the in-field generated data, is presented on the “Geologic Cross Section A – A’,” Figure 3.

- The ground surface at the Sun Peaks Estates and in the immediate surrounding area is covered by a layer of low-permeability glacial till sediments that are underlain at a relatively shallow depth by Chuckanut Formation bedrock.
- The glacial till sediments appear to be a few tens of feet thick in the vicinity of the site and generally consist of various amounts of clay, silt, sand, gravel, cobbles, and boulders. The till sediments are dense, have a low permeability, and are considered to act as a confining unit, not an aquifer, by the USGS (SIR 2009-5270).
- The Chuckanut Formation consists of alternating intervals of coarse-grained (sandstone and minor conglomerate) and fine-grained (mudstone, fine-grained sandstone, and siltstone) deposits. The USGS reports indicate that fractured/permeable portions of the Chuckanut Formation form a “Sedimentary Aquifer (OEc).”
- The Sedimentary Aquifer present within the fractured/permeable portions of the Chuckanut Formation deposits underlies the Sun Peaks Estates. The aquifer is unconfined where it crops out and can be confined in areas where it is fully saturated and covered by glacial sediments. Also fine-grained bedrock intervals within the Sedimentary Aquifer may produce local confined conditions.
- The USGS field-located 10 wells completed within the Sedimentary Aquifer located within roughly 3 miles of the Sun Peaks Estates site, determined their approximate ground surface elevations using Light Detection and Ranging (LiDAR) information, and field-measured depths to water in the wells on several occasions (SIR 2009-5270). Copies of water well reports for the 10 field-located USGS wells are included in Attachment A.
- The ground water elevation data obtained from the USGS wells was used to develop contours of ground water elevations in the Sedimentary Aquifer, as shown on Figure 1. The USGS regional ground water data indicates the following:
 - i. The regional ground water flow direction in the Sedimentary Aquifer beneath the

Sun Peaks Estates site is to the south towards the Stillaguamish River basin (Figure 1).

- ii. The depth to ground water in the USGS monitored wells ranged from approximately 24 feet to over 140 feet below the ground surface (Attachment A). All depths referenced in this report are relative to ground surface unless otherwise noted.
- iii. Ground water in the Sedimentary Aquifer is at an elevation of roughly 500 feet above mean sea level beneath the Sun Peaks Estates (Figure 1, SIR 2009-5270).

Site-Specific Geology and Hydrogeology

The 12 domestic wells drilled at Sun Peaks Estates range in depth from 42 feet to 425 feet and are completed within fractured, water-bearing sedimentary bedrock. A representative of AESI and John Rose of Ecology field-located and measured the depths to ground water in 11 of the 12 on-site wells on August 3, 2012. They were unable to locate the well on Lot 10 during their August 3 site activities. The specific location of each wellhead was determined using a hand-held near-survey grade Trimble GeoXT GPS with a hurricane antenna provided by Ecology. The depths to water were measured using an Olympic well probe model 500. A representative of AESI returned to the site on August 8 and field-located the well on Lot 10. The depth to ground water in the Lot 10 well was measured using a Waterline well probe and the approximate location of the wellhead was determined using a hand-held Garmin GPS unit and a review of historical aerial photographs.

The ground surface elevation at each wellhead was determined from LiDAR elevation information (Snohomish County 2003 flight) and the field-generated GPS location data. The ground surface elevation, measured casing stickup, and depth to ground water data were used to estimate the elevation of ground water in each well. A summary of well construction, location, and water level details for the on-site wells is presented in Table 1. Copies of the water well reports for each well is included in Attachment A. The approximate location of each well at the Sun Peaks Estates site is shown on Figure 2.

The wells completed at the Sun Peaks Estates site all appear to have encountered roughly 25 feet (Lot 11) to 80 feet (Lot 9) of relatively dense, low-permeability glacial till overlying sedimentary bedrock (Attachment A, Figure 3). Ground water was not indicated as being encountered in the overlying glacial till sediments at the site by the water well drillers (Attachment A). The bedrock consists of a fine-grained upper sediment package that extended to depths of roughly 120 feet to 170 feet and was described as consisting of fine-grained sandstone, shale, and siltstone (Attachment A, Figure 3). The upper bedrock unit is underlain by what was typically described as gray coarse sandstone with minor layers of shale, siltstone,

and fine-grained sandstone, which is referred to as the lower bedrock unit for the purposes of this report (Attachment A, Figure 3). The on-site wells were constructed with 6-inch-diameter steel casing that was extended through the glacial till sediments and a minimum of 3 feet into the top of the underlying bedrock with the exception of the Lot 1 well, where the 6-inch casing only penetrated the bedrock approximately 1 foot (Attachment A). PVC liners (4.5- to 5.0-inch-diameter) were installed to the completion depths of the wells located on Lots 3 through 12 (Attachment A, Figure 3). The PVC liners were slotted to allow the entry of ground water through the open areas (Attachment A, Table 1). The wells installed on Lots 1 and 2 were completed as open-end casing without PVC liners.

Nine of the on-site wells (Lots 3, 4, 5, 6, 7, 8, 9, 11, and 12) appear to intercept water-bearing, fractured sandstone in the lower bedrock unit at depths of greater than 140 feet below the ground surface (Table 1, Figure 3). The depths to ground water in eight of the wells ranged between approximately 145 feet (Lot 3) and 177 feet (Lot 12), which correspond to a rough elevation range of 502 feet to 517 feet above mean sea level (Table 1, Figure 3). The ground water elevation measured in the well located on Lot 9 was approximately 580 feet above mean sea level (Table 1). With the exception of the Lot 9 well, the range of ground water elevations in the wells completed in the lower bedrock unit at the Sun Peaks Estates site correspond closely to the USGS estimated elevation of 500 feet for the Sedimentary Aquifer at the site (Figures 1 and 3, Table 1).

The wells on the remaining three lots (Lots 1, 2, and 10) appear to intercept localized shallow water-bearing fractures in the upper bedrock unit that begin at depths of roughly 40 to 60 feet (Table 1, Figure 3). The depth to ground water measured in the shallow wells in August 2012 ranged from less than 10 feet (Lot 2) to approximately 20 feet (Lot 10), which correspond to a range in elevation from roughly 641 feet to 622 feet above mean sea level (Table 1, Figure 3).

Yields from the on-site wells, as reported by the well drillers on the water well reports, range from approximately 1.5 gallons per minute (gpm) to 35 gpm and appear to be adequate for single-family domestic use (Attachment A). Reported yields for the three wells completed in the upper bedrock unit are an average of roughly 3.5 gpm. Yields from the wells completed in the lower bedrock unit are reported as an average of approximately 11 gpm (Attachment A).

³ Ground water elevations based on LiDAR ground surface elevations plus field-measured casing stickup.

⁴ Location determined using a hand-held GPS unit and check using Google Earth aerial photographs.

DISCUSSION AND CONCLUSIONS

General

The regional USGS study and site-specific data indicate that Sun Peaks Estates is underlain by what the USGS refers to as the Sedimentary Aquifer which is located within fractured portions of the Chuckanut Formation bedrock at depths greater than approximately 140 feet. The Sedimentary Aquifer is separated from the ground surface at the site by several 10s of feet of dense, low-permeability glacial till and/or un-fractured low-permeability bedrock. The site-specific data does not indicate that there are water-bearing zones in the glacial till or that the Sedimentary Aquifer is in hydraulic continuity with surface waters in the immediate vicinity of the site. This lack of hydraulic continuity is further demonstrated by the seasonal nature of the tributary stream that flows through the Sun Peaks Estates site. AESI's on-site observations and discussions with local landowners indicates that the seasonal stream channel which bisects the Sun Peaks Estates is generally dry (no surface water or ground water discharge/seepage) between roughly July and October of each year. As discussed below, ground water in the Sedimentary Aquifer immediately beneath Sun Peaks Estates does not appear to be a source of water to Fisher Creek or the Fisher-Carpenter Creek subbasin.

Nine of the on-site wells (Lots 3, 4, 5, 6, 7, 8, 9, 11, and 12), including five of the appellant wells (Lots 3, 4, 7, 9, and 11), are completed at depths greater than 140 feet and appear to be intercepting water from the regional Sedimentary Aquifer. The water level elevations in eight of these wells correspond very well with the ground water elevations in the regional Sedimentary Aquifer system described by the USGS (Figure 1, Table 1). The water level in the well located on Lot 9 is approximately 60 feet higher in elevation than the water levels in the other eight wells (Figure 3). It is possible that ground water from a higher fracture zone in the bedrock is migrating down the outside of the 6-inch-diameter steel casing and influencing the ground water level in this well. However, it should be noted that the ground water in the well on Lot 9 is hydraulically separated from the ground surface by over 70 feet of low-permeability bedrock and glacial till (Figure 3).

The data presented in the USGS reports indicate that the regional ground water flow direction in the Sedimentary Aquifer beneath the Sun Peaks Estates is toward the south. Therefore, removing ground water from the five wells (Lots 3, 4, 7, 9, and 11) completed in the Sedimentary Aquifer beneath the Sun Peaks Estates site at the relatively low rate of 350 gpd per well could ultimately cause a potential decrease in ground water throughflow to the Stillaguamish River basin; however, these withdrawals would not have a negative impact on ground water quantity or flow direction in the Fisher Creek subbasin, or result in a diminishment of surface water flow in Fisher Creek. The Sedimentary Aquifer beneath Sun Peaks Estates is not a source of water to Fisher Creek or the Fisher-Carpenter Creek subbasin.

There are three shallow on-site wells (Lots 1, 2, and 10), including two appellant wells (Lots 2 and 10), that appear to be intercepting relatively shallow localized, water-bearing fracture zones within the upper portion of the Chuckanut Formation. The shallow fracture system appears to be hydraulically separated from the ground surface by a few 10s of feet of low-permeability glacial till sediments. Water level information for the three shallow wells indicate confined conditions with static water levels near and, in one well (Lot 1), seasonally above the ground surface. The direction of ground water flow in the shallow fracture system cannot be determined based on the limited available data. Although the shallow fracture system appears to be hydraulically separated from surface water sources in the immediate vicinity of Sun Peaks Estates, it cannot be determined if a portion of the ground water flowing through the upper fracture system ultimately provides recharge to Fisher Creek. Furthermore, it cannot be determined without further study if withdrawals from the three shallow wells would negatively impact ground water flow within the Fisher-Carpenter Creek subbasin or diminish surface water flow in Fisher Creek.

MITIGATION PLAN

No Negative Net Impact from Sun Peaks Estates Appellant Wells

Five of the seven appellant wells (Lots 3, 4, 7, 9, and 11) will withdraw water from the Stillaguamish River basin, and ultimately provide ground water recharge to the Fisher-Carpenter Creek subbasin by virtue of their septic systems and possible outdoor uses. As only two of the seven appellant wells (Lots 2 and 10) could potentially decrease ground water recharge in the Fisher-Carpenter Creek subbasin, with the remaining five wells adding water to the subbasin, there is no overall potential negative net impact to ground water recharge/surface water flow in the Fisher Creek subbasin from the combined use of the appellant wells at the Sun Peaks Estates. The concept of no negative impact to or diminishment of ground water flow/surface water recharge in the Fisher-Carpenter Creek subbasin from the combined use of the seven appellant wells is discussed in detail below.

Five of the seven appellants (owners of Lots 3, 4, 7, 9, and 11) have wells that are completed in the deep regionally extensive Sedimentary Aquifer. These wells are intercepting ground water that provides recharge to the Stillaguamish River basin and do not appear to have hydraulic continuity with the Fisher-Carpenter Creek subbasin. Water Resource Inventory Area (WRIA) 5 – Stillaguamish River basin reservation system for permit-exempt domestic wells (WAC 173-505-090) accounts for water use at a rate of 350 gpd and limits outdoor water use to the watering of 1/12 acre for domestic exempt wells, as more particularly stated in the rule. The 350 gpd can be reduced to 175 gpd if the residence is served by an on-site septic system located in the same WRIA, which is not the case for the appellant's properties at Sun Peaks Estates. Therefore, the maximum potential negative impact to ground water recharge/surface water in the Stillaguamish River basin is 350 gpd per well, which is equal to an annual total of approximately 0.39 acre-feet (ac-ft) per well or a maximum of 1.95 ac-ft for the five wells.

Unmitigated reservation water is still available in the Stillaguamish River basin. Debit water for the total potential impact of 1.95 ac-ft per year from the use of the wells on Lots 3, 4, 7, 9, and 11 needs be accounted for in the Stillaguamish River reservation.

As previously discussed, the Stillaguamish River basin reservation system assumes that of the 350 gpd removed from a well, 175 gpd is returned to the hydrogeologic system as septic return flow. Therefore, the five wells located on Lots 3, 4, 7, 9, and 11 will be providing a total of 875 gpd (0.98 ac-ft per year) of additional ground water recharge to the Fisher-Carpenter Creek subbasin that was obtained from the Stillaguamish River basin.

Two of the seven appellant wells (Lots 2 and 10) are completed in relatively shallow localized fracture zones with depths to static water that are less than roughly 50 feet. Due to their shallow completion depths and the relatively shallow depth to ground water, the use of these wells, without drilling them deeper, has a slight potential to negatively impact ground water recharge in the Fisher-Carpenter Creek subbasin and diminish surface water flow in Fisher Creek. The maximum potential impact to ground and/or surface water in the Fisher-Carpenter Creek subbasin from the use of these wells is 175 gpd per lot, which is a total of 0.39 ac-ft per year.

In summary, the use of the wells completed on Lots 3, 4, 7, 9, and 11 will result in the import of an additional 0.98 ac-ft per year of ground water recharge from the Stillaguamish River basin to the Fisher-Carpenter Creek subbasin. The use of the wells on Lots 2 and 10 could result in a decrease in ground water recharge in the Fisher-Carpenter Creek subbasin a maximum of 0.39 ac-ft per year. Therefore, the combined impact resulting from the use of the seven appellant wells is a net positive increase in ground water recharge to the Fisher-Carpenter Creek subbasin of 0.59 ac-ft per year. The importation of water from the Stillaguamish River basin from Lots 3, 4, 7, 9, and 11 totally offsets the maximum potential impact from the use of the wells located on Lots 2 and 10.

Accordingly, consistent with WAC 173-505-060(1)(c) requirements of monitoring and reporting, Lots 3, 4, 7, 9 and 11 will comply with the necessary and lawful conditions stated in WAC 173-505-090(2), and Lots 2 and 10 will also install a metering device consistent with Lots 3, 4, 7, 9 and 11, for reporting and monitoring. Pursuant to WAC 173-503-060(1)(c), for reporting and quality assurance/control, the Lots will report their metered use annually to Ecology, and agree to keep septic recharge on the properties or its equivalent quantities.

Contingent Alternative Mitigation Plan

If and only if the above mitigation plan is lawfully determined by Ecology to be inadequate, the following contingent alternative mitigation plan is proposed.

The potential negative impact to ground water recharge in the Fisher-Carpenter Creek subbasin due to the use of the shallow wells located on Lots 2 and 10, though already offset by a net positive impact from Sun Peak Estates as an entirety, could also be eliminated if the shallow wells on Lot 2 and 10 were deepened and completed within the Sedimentary Aquifer. Based upon the hydrogeological assessment, the use of the Lot 2 and 10 wells modified in this manner (deepened) would result in removing ground water from the Stillaguamish River basin and would not result in any negative impact to ground water recharge in the Fisher-Carpenter Creek subbasin or a diminishment of flow in Fisher Creek, offset or otherwise.

Therefore, a proposed contingent alternative mitigation plan is as follows:

1. Remove the PVC liners installed in the wells located on Lots 2 and 10.
2. Drill the wells to depths greater than roughly 140 feet.
3. Confirm that the static water level elevations in the deepened wells are in the range of approximately 500 to 520 feet indicating that the wells are intercepting the regional Sedimentary Aquifer.
4. Install a new PVC liner in each well that is slotted in a manner which allows water from the deep Sedimentary Aquifer to enter the well.
5. Each owner of the deepened wells on Lot 2 and 10, in addition to the owners of Lots 3, 4, 7, 9 and 11, will also comply with the necessary and lawful conditions stated in WAC 173-505-090(2).

LIMITATIONS

We have prepared this report for the use of the identified seven appellants in regard to the use of single-family domestic wells at the Sun Peaks Estates in Snohomish County. The conclusions and interpretations presented in this report should not be construed as a warranty of the subsurface conditions. Our conclusions and recommendations are based on our review of the information described in this report and our interpretation of best available science at the time of this reports preparation. Our experience has shown that soil and ground water conditions can vary significantly over small distances.

Within the limitations of scope, schedule, and budget, AESI attempted to execute these services in accordance with generally accepted professional principles in the field of hydrogeology at the time this report was prepared. No warranty, express or implied, is made.

We have enjoyed working with you and are confident that these recommendations will aid in the successful completion of your project. If you should have any questions or require further assistance, please do not hesitate to call.

Sincerely,
ASSOCIATED EARTH SCIENCES, INC.

Water Right Permit No. _____

Property Owner Name Jim Yencich

Well Street Address 316 29 1ath Drive NW

City Stanwood County Snohomish Lot

Location SE 1/4 SE 1/4 Sec 2 Twn 32R4 WWM circle #1

PROPOSED USE: Domestic Industrial Municipal DeWater Irrigation Test Well Other

TYPE OF WORK: Owner's number of well (if more than one) _____
 New well Reconditioned Method: Dig Bored Driven
 Deepened Cable Rotary Jetted

DIMENSIONS: Diameter of well 6 inches, drilled 48 ft.
 Depth of completed well 48 ft.

CONSTRUCTION DETAILS
 Casing: Welded 6" Diam. from 0 ft. to 46 ft.
 Installed: Liner installed Threaded
 Diam. Slot size from ft. to ft.

Perforations: Yes No
 Type of perforator used _____
 SIZE of perforations in. by in. and no. of perforations from ft. to ft.

Screens: Yes No K-Pan Location _____
 Manufacturer's Name _____
 Type _____ Model No. _____
 Diam. Slot size from ft. to ft.

Gravel/Filter packed: Yes No Size of gravel/sand _____
 Materials placed from _____ ft. to _____ ft.

Surface Seal: Yes No To what depth? 18 ft.
 Material used in seal Benitoinite chips

Did any strata contain unusable water? Yes No
 Type of water? _____ Depth of strata _____

Method of sealing strata off _____

PUMP: Manufacturer's Name Grundfos
 Type: SUB H.P. 3/4

WATER LEVELS: Land-surface elevation above mean sea level _____
 Static level +1 ft. below top of well Date: 2 28 08

Artesian pressure _____ lbs. per square inch Date _____
 Artesian water is controlled by _____ (cap, valve, etc.)

WELL TESTS: Drawdown is amount water level is lowered below static level
 Was a pump test made? Yes No If yes, by whom? David

Yield: 4 gal./min. with 44 ft. drawdown after 3 hrs.
 Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.
 Yield: _____ gal./min. with _____ ft. drawdown after _____ hrs.

Recovery data (time taken to zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level

Date of test _____
 Boiler test 4 gal./min. with 20 ft. drawdown after 1 hrs.

Air test _____ gal./min. with stem set at _____ ft. for _____ hrs.
 Artesian flow _____ g.p.m. Date _____

Temperature of water _____ Was a chemical analysis made? Yes No

Lat/Long (s, t, r) Lat Deg _____ Lat Min/Sec _____
 Still REQUIRED) Long Deg _____ Long Min/Sec _____

Tax Parcel No. 010757 0000100

CONSTRUCTION OR DECOMMISSION PROCEDURE

Formation: Describe by color, character, size of material and structure, and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of information. (USE ADDITIONAL SHEETS IF NECESSARY.)

MATERIAL	FROM	TO
tan clay	0	2
tan conglomerate	2	16
gray conglomerate	16	20
gray silty sand clay	20	24
gray silty sand with small gravel	24	33

WATER WELL REPORT

Original & 1st copy - Ecology, 2nd copy - owner, 3rd copy - driller

Construction/Decommission ("x" in circle)

Construction
 Decommission ORIGINAL INSTALLATION Notice of Intent Number _____

PROPOSED USE: Domestic Industrial Municipal
 DeWater Irrigation Test Well Other

TYPE OF WORK: Owner's number of well (if more than one) _____
 New well Reconditioned Method: Dug Bored Driven
 Deepened Cable Rotary Jetted

DIMENSIONS: Diameter of well 6 inches, drilled 200
 Depth of completed well 200 ft.

CONSTRUCTION DETAILS
 Casing: Welded 6 Diam. from 0 ft. to 117 ft.
 Installed: Liner installed 45 Diam. from -20 ft. to 200 ft.
 Threaded Diam. from _____ ft. to _____ ft.

Perforations: Yes No
 Type of perforator used Slotted Pipe
 SIZE of ports 3/16 in. by 7 in. and no. of ports 120 from 140 ft. to 200

Screens: Yes No K-Pac Location _____
 Manufacturer's Name _____ Model No. _____
 Type _____ Slot size _____ from _____ ft. to _____ ft.
 Diam. _____ Slot size _____ from _____ ft. to _____ ft.

Gravel/Filter packed: Yes No Size of gravel/sand _____ ft. to _____ ft.
 Materials placed from _____

Surface Seal: Yes No To what depth? 18 ft.
 Material used in seal Bentinite chips
 Did any strata contain unusable water? Yes No
 Type of water? _____ Depth of strata _____
 Method of sealing strata off _____

PUMP: Manufacturer's Name Acme H.P. 1/2
 Type: SUB

WATER LEVELS: Land surface elevation above mean sea level _____ ft.
 Static level 140 ft. below top of well Date 7/24/08
 Artesian pressure _____ lbs. per square inch. Date _____
 Artesian water is controlled by _____ (cap, valve, etc.)

WELL TESTS: Drawdown is amount water level is lowered below static level
 Was a pump test made? Yes No If yes, by whom? Driller
 Yield: 3 gal/min with 22 ft. drawdown after 4 hrs.
 Yield: _____ gal/min with _____ ft. drawdown after _____ hrs.
 Yield: _____ gal/min with _____ ft. drawdown after _____ hrs.

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level
1100	162	1105	158	1200	150

 Date of test 7/30/08
 Bailor test 5 gal/min. with 60 ft. drawdown after 1 hrs.
 Airstream _____ gal/min. with screen set at _____ ft. for _____ hrs.
 Artesian flow _____ g.p.m. Date _____
 Temperature of water _____ Was a chemical analysis made? Yes No

WATER WELL REPORT

STATE OF WASHINGTON

Notice of Intent W136810

UNIQUE WELL I.D.# AFP952

Water Right Permit No. 33-4E-34P

(1) OWNER: Name John & Michele Yengich

Address 23734 Fremali Lane, Mt. Vernon, WA 98274

(2) LOCATION OF WELL: County Skagit

SE 1/4 SW 1/4 Sec 34 T 33 N.R. 4E WM

(2a) STREET ADDRESS OF WELL (or nearest address) same

TAX PARCEL NO. _____

(3) PROPOSED USE: Domestic Industrial Municipal
 Irrigation Test Well Other
 DeWater

(4) TYPE OF WORK: Owner's number of well (if more than one) _____

New Well Method Bored
 Deepened Dug Driven
 Reconditioned Cable Jetted
 Decommission Rotary

(5) DIMENSIONS: Diameter of well 6 inches
 Drilled 500 feet Depth of completed well 500 ft

(6) CONSTRUCTION DETAILS:

Casing installed:

Welded 6 " Diam from +2 ft to 64 ft
 Liner installed 4 " Diam from -10 ft to 500 ft
 Threaded _____ " Diam. from _____ ft. to _____ ft.

Perforations: Yes No

Type of perforator used _____

SIZE of perforations _____ in by _____ in
 _____ perforations from _____ ft to _____ ft
 _____ perforations from _____ ft to _____ ft
 _____ perforations from _____ ft to _____ ft

Screens: Yes No K-Pac Location _____

Manufacturer's Name Monoflex

Type S.S. Model No _____
 Diam 4 Slot size 20 from 250 ft to 260 ft
 Diam 4 Slot size 20 from 450 ft to 460 ft

Gravel/Filter packed: Yes No Size of gravel/sand _____
 Material placed from _____ ft to _____ ft.

Surface seal: Yes No To what depth? _____ ft.

Material used in seal _____

Did any strata contain unusable water? Yes No

Type of water? _____ Depth of strata _____

Method of sealing strata off _____

(7) PUMP: Manufacturer's Name _____

Type _____ H P _____

(8) WATER LEVELS: Land-surface elevation above mean sea level _____ ft
(379 MSL)

Static level 194' ft below top of well Date 07/26/2001

Artesian pressure _____ lbs per square inch Date _____

Artesian water is controlled by _____ (Cap, valve, etc)

(9) WELL TESTS: Drawdown is amount water level is lowered below static level

Was a pump test made? Yes No If yes, by whom? _____

Yield: _____ gal/min with _____ ft drawdown after _____ hrs

Yield: _____ gal/min with _____ ft drawdown after _____ hrs

Yield: _____ gal/min with _____ ft drawdown after _____ hrs.

Recovery data (time taken as zero when pump turned off) (water level measured from well top to water level)

Time	Water Level	Time	Water Level	Time	Water Level

Date of test _____

Seiler test _____ gal/min with _____ ft drawdown after _____ hrs

Arttest 1/4 gal/min. with stem set at 500 ft. for 1 hrs

Artesian flow _____ g.p.m Date _____

Temperature of water _____ Was a chemical analyses made? Yes No

(10) WELL LOG or DECOMMISSIONING PROCEDURE DESCRIPTION:
 Formation: Describe by color, character, size of material and structure, and the kind and nature of the material in each stratum penetrated, with at least one entry for each change of information. Indicate all water encountered

MATERIAL	FROM	TO
topsoil	0	2
brown clay gravel	2	15
gray clay gravel	15	26
granite boulder	26	27
gray gravel clay	27	44
brown clay gravel	44	51
